

TeX Commands available in MathJax

[Jump to the alphabetical list of commands](#)

THIS IS A BIG PAGE.

It takes a long time to process (probably about 2-3 minutes).
You can watch the progress in the lower left corner—it loads most reliably if you **resist the temptation to click on something before it's done**.
I think it's worth the wait (but of course I'm biased).
You can read about why it's so big below.

This document was created in Spring of 2011.
It's processed using the current version of MathJax, via [the MathJax Content Distribution Network \(CDN\)](#).

I ([Dr. Carol JVF Burns](#)) have prepared this page to thoroughly familiarize myself with the TeX commands that are available in MathJax, and to provide a resource that may be useful to other MathJax users.
Davide Cervone, the lead developer of MathJax, has most generously provided extensive edits, and this page is greatly improved due to his efforts; I owe him countless thanks.

All mistakes on this page are my own (and I welcome suggestions and corrections): fishcaro@verizon.net

MathJax allows a syntax modeled on both TeX and LaTeX.
Therefore, web authors can use familiar and concise commands when creating mathematics with MathJax.

Alphabetical List of TeX Commands available in MathJax

[Click to show/hide: Characteristics of the Alphabetical Command Tables](#)

[symbols](#)

[A](#) | [B](#) | [C](#) | [D](#) | [E](#) | [F](#) | [G](#) | [H](#) | [I](#) | [J](#) | [K](#) | [L](#) | [M](#) | [N](#) | [O](#) | [P](#) | [Q](#) | [R](#) | [S](#) | [T](#) | [U](#) | [V](#) | [W](#) | [X](#) | [Y](#) | [Z](#)
[environments](#)

Know the *shape* of a character that you want, but not its name? [Draw it here!](#)

Depending on your configuration, to get [AMSSymbols](#) or [AMSmath](#), you may need to load some extensions in MathJax.Hub.Config.
For example:
extensions: ["tex2jax.js", "TeX/noErrors.js", "TeX/AMSSymbols.js", "TeX/AMSmath.js"].

symbols

#	<p>indicates numbered arguments in definitions</p> <p>Example:</p> <pre>\def\specialFrac#1#2{\frac{x + #1}{y + #2}} \specialFrac{7}{z+3}</pre> <p>yields $\frac{x + 7}{y + z + 3}$</p>
%	<p>used for a single-line comment; shows only in the source code; does not show in the rendered expression</p> <p>Example (showing the math block delimiters):</p> <pre>\$\$ % Note: (x+1)^2 is NOT x^2 + 1 (x+1)^2 % original expression = (x+1)(x+1) % definition of exponent = x^2 + 2x + 1 % FOIL, combine like terms \$\$</pre> <p>yields $(x + 1)^2 = (x + 1)(x + 1) = x^2 + 2x + 1$</p> <p>Internet Explorer caution: show/hide more info Some versions of Internet Explorer convert newlines to spaces when building the page DOM, so that something like</p> <pre>\begin{equation} % some comment a = b + c \end{equation}</pre> <p>becomes</p> <pre>\begin{equation} % some comment a = b + c \end{equation}</pre> <p>before MathJax sees it. Thus,</p> <pre>some comment a = b + c \end{equation}</pre> <p>is all treated as a comment, causing a 'missing \end{equation}' error.</p>

	<p>It is therefore recommended that you keep comments <i>outside</i> of math mode (using HTML comment style). If you must use comments within mathematics, then it is best to end them with <code>
</code> (as of version 1.1a): for example, <code>\$x + y % a comment
\$</code> yields $x + y$</p>								
&	<p>used as separators in alignment environments; used in HTML entity references within math mode; for a literal ampersand, use <code>\&</code></p> <p>Examples:</p> <pre>\begin{matrix} a & \& b \\ c & \& d \end{matrix}</pre> <p>yields $a \quad b$ $c \quad d$</p> <pre>a &lt; b</pre> <p>yields $a < b$</p> <pre>\text{Carol } \& \text{ Julia}</pre> <p>yields Carol & Julia</p>								
^	<p>used to indicate exponents; used to indicate superscripts; used for limits on large operators and in some ‘vertical’ constructions (see examples)</p> <p style="text-align: center;"><code><optional #1> ^ #2</code></p> <p>argument #1 is optional; use braces, as needed, to clarify what is the exponent</p> <p>Examples:</p> <pre>^i</pre> <p>yields i</p> <pre>x^i_2</pre> <p>yields x_2^i</p> <pre>{x^i}_2</pre> <p>yields x^i_2</p> <pre>x^{i_2}</pre> <p>yields x^{i_2}</p> <pre>x^{i^2}</pre> <p>yields x^{i^2}</p> <pre>{x^i}^2</pre> <p>yields x^{i^2} Note: <code>x^i^2</code> yields an error.</p> <pre>^ax^b</pre> <p>yields $a x^b$</p> <pre>\sum_{n=1}^{\infty}</pre> <p>yields $\sum_{n=1}^{\infty}$ (inline mode)</p> <pre>\overbrace{x+\cdots+x}^{n \text{ times}}</pre> <p>yields $\overbrace{x + \cdots + x}^{n \text{ times}}$</p>								
_	<p>used to indicate subscripts; used for limits on large operators and in some ‘vertical’ constructions (see examples)</p> <p style="text-align: center;"><code><optional #1> _ #2</code></p> <p>argument #1 is optional; use braces, as needed, to clarify what is the subscript</p> <p>Examples:</p> <pre>_2</pre> <p>yields 2</p> <pre>x_i^2</pre> <p>yields x_i^2</p> <pre>{x_i}^2</pre> <p>yields x_i^2</p> <pre>x_{i^2}</pre> <p>yields x_{i^2}</p> <pre>x_{i_2}</pre> <p>yields x_{i_2}</p> <pre>{x_i}_2</pre> <p>yields x_{i_2} Note: <code>x_i_2</code> yields an error.</p> <pre>^a_b x^c_d</pre> <p>yields $\frac{a}{b} x^c_d$</p> <pre>\sum_{n=1}^{\infty}</pre> <p>yields $\sum_{n=1}^{\infty}$ (inline mode)</p> <pre>\underbrace{x+\cdots+x}_{n \text{ times}}</pre> <p>yields $\underbrace{x + \cdots + x}_{n \text{ times}}$</p>								
{ }	<p>braces, used for grouping; for literal braces, use <code>\{ and \}</code></p> <p>There are two basic grouping constructs that use braces; I will refer to them as ‘arguments’ versus ‘braced groups’. If you're not aware which construct is in force, then you can get unexpected results. The examples below should clarify.</p> <p>ARGUMENTS: In this documentation, arguments are indicated by #1, #2, etc. An argument is either a single ‘token’ (like ‘a’ or ‘\alpha’), or is a group enclosed in braces. For example, the <code>\boldsymbol</code> command takes an argument, notated by:</p> <p style="text-align: center;"><code>\boldsymbol #1</code></p> <p>Thus:</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="padding: 2px;"><code>\boldsymbol aa</code></td> <td style="padding: 2px;">yields</td> <td style="padding: 2px;">aa</td> <td style="padding: 2px;">the first token, ‘a’, becomes bold</td> </tr> <tr> <td style="padding: 2px;"><code>\boldsymbol \alpha\alpha</code></td> <td style="padding: 2px;">yields</td> <td style="padding: 2px;">$\alpha\alpha$</td> <td style="padding: 2px;">the first token, ‘\alpha’, becomes bold</td> </tr> </table>	<code>\boldsymbol aa</code>	yields	aa	the first token, ‘a’, becomes bold	<code>\boldsymbol \alpha\alpha</code>	yields	$\alpha\alpha$	the first token, ‘\alpha’, becomes bold
<code>\boldsymbol aa</code>	yields	aa	the first token, ‘a’, becomes bold						
<code>\boldsymbol \alpha\alpha</code>	yields	$\alpha\alpha$	the first token, ‘\alpha’, becomes bold						

		<table border="1"> <tr> <td><code>\boldsymbol{a\alpha}a\alpha</code></td> <td>yields</td> <td>$\alpha\alpha\alpha$</td> <td>braces have been used to make the argument the group 'a\alpha', so both become bold</td> </tr> </table> <p>BRACED GROUPS: A 'braced group' is a group, enclosed by braces, inside which some behavior is in force. The <code>\bf</code> (boldface) command operates inside a braced group, notated by:</p> $\{\bf \dots \}$ <p>Here, <code>\bf</code> is a switch, which 'turns on' boldface inside the braced group; boldface ends when the braced group ends.</p> <p>Sometimes, you may not see the opening '{' that signals the start of a braced group. In this situation, when does a command (like <code>\bf</code>) end? It ends at whichever occurs first:</p> <ul style="list-style-type: none"> • it is replaced by a competing command (e.g., <code>\bf</code> is replaced by <code>\rm</code>) • the end of math mode (math delimiters form an implicit local group) <p>Examples: (explicit braced groups are indicated in red, for your convenience)</p> <table border="1"> <tr> <td><code>\bf ab</code></td> <td>yields</td> <td>ab</td> <td>turn on boldface; stays on to end of math mode</td> </tr> <tr> <td><code>{\bf ab}cd</code></td> <td>yields</td> <td>abcd</td> <td>an explicit braced group is entered; the 'cd' falls outside this group</td> </tr> <tr> <td><code>\bf{ab}cd</code></td> <td>yields</td> <td>abcd</td> <td>turn on boldface; stays on to end of math mode; the braces here are extraneous</td> </tr> <tr> <td><code>{\bf{ab}c}d</code></td> <td>yields</td> <td>abcd</td> <td>boldface operates inside a braced group; the 'd' falls outside this group</td> </tr> <tr> <td><code>{efg\bf{ab}c}d</code></td> <td>yields</td> <td><i>efg</i>abcd</td> <td>the 'efg' occur before boldface is turned on</td> </tr> <tr> <td><code>ab \bf cd \rm ef</code></td> <td>yields</td> <td><i>ab</i>cd<i>ef</i></td> <td>the competing <code>\rm</code> replaces boldface</td> </tr> <tr> <td><code>ab \bf cd {\rm ef} gh</code></td> <td>yields</td> <td><i>ab</i>cd<i>efgh</i></td> <td>the 'gh' is still in boldface</td> </tr> </table> <p>Make sure you see the difference in the behaviors below:</p> <table border="1"> <tr> <td><code>\boldsymbol{ab}cd</code></td> <td>yields</td> <td>abcd</td> <td><code>\boldsymbol</code> takes an argument</td> </tr> <tr> <td><code>\bf{ab}cd</code></td> <td>yields</td> <td>abcd</td> <td><code>\bf</code> does not take an argument; instead, <code>\bf</code> 'turns on' boldface behavior</td> </tr> </table>	<code>\boldsymbol{a\alpha}a\alpha</code>	yields	$\alpha\alpha\alpha$	braces have been used to make the argument the group 'a\alpha', so both become bold	<code>\bf ab</code>	yields	ab	turn on boldface; stays on to end of math mode	<code>{\bf ab}cd</code>	yields	abcd	an explicit braced group is entered; the 'cd' falls outside this group	<code>\bf{ab}cd</code>	yields	abcd	turn on boldface; stays on to end of math mode; the braces here are extraneous	<code>{\bf{ab}c}d</code>	yields	abcd	boldface operates inside a braced group; the 'd' falls outside this group	<code>{efg\bf{ab}c}d</code>	yields	<i>efg</i> abcd	the 'efg' occur before boldface is turned on	<code>ab \bf cd \rm ef</code>	yields	<i>ab</i> cd <i>ef</i>	the competing <code>\rm</code> replaces boldface	<code>ab \bf cd {\rm ef} gh</code>	yields	<i>ab</i> cd <i>efgh</i>	the 'gh' is still in boldface	<code>\boldsymbol{ab}cd</code>	yields	abcd	<code>\boldsymbol</code> takes an argument	<code>\bf{ab}cd</code>	yields	abcd	<code>\bf</code> does not take an argument; instead, <code>\bf</code> 'turns on' boldface behavior	
<code>\boldsymbol{a\alpha}a\alpha</code>	yields	$\alpha\alpha\alpha$	braces have been used to make the argument the group 'a\alpha', so both become bold																																								
<code>\bf ab</code>	yields	ab	turn on boldface; stays on to end of math mode																																								
<code>{\bf ab}cd</code>	yields	abcd	an explicit braced group is entered; the 'cd' falls outside this group																																								
<code>\bf{ab}cd</code>	yields	abcd	turn on boldface; stays on to end of math mode; the braces here are extraneous																																								
<code>{\bf{ab}c}d</code>	yields	abcd	boldface operates inside a braced group; the 'd' falls outside this group																																								
<code>{efg\bf{ab}c}d</code>	yields	<i>efg</i> abcd	the 'efg' occur before boldface is turned on																																								
<code>ab \bf cd \rm ef</code>	yields	<i>ab</i> cd <i>ef</i>	the competing <code>\rm</code> replaces boldface																																								
<code>ab \bf cd {\rm ef} gh</code>	yields	<i>ab</i> cd <i>efgh</i>	the 'gh' is still in boldface																																								
<code>\boldsymbol{ab}cd</code>	yields	abcd	<code>\boldsymbol</code> takes an argument																																								
<code>\bf{ab}cd</code>	yields	abcd	<code>\bf</code> does not take an argument; instead, <code>\bf</code> 'turns on' boldface behavior																																								
<code>\!</code>		negative thin space; i.e., it 'back ups' a thin space amount																																									
<code>\,</code> <code>\:</code> <code>\></code> <code>\;</code>		<code>\,</code> thin space (normally $\frac{1}{6} = \frac{3}{18}$ of a quad) <code>\:</code> medium space (normally $\frac{2}{9} = \frac{4}{18}$ of a quad) <code>\></code> alternate medium space <code>\;</code> thick space (normally $\frac{5}{18}$ of a quad)	<p>Examples:</p> <p>normal spacing between letters: <i>abababab</i></p> <p>using <code>\,</code> between letters: <i>a b a b a b a b</i></p> <p>using <code>\:</code> between letters: <i>a b a b a b a b</i></p> <p>using <code>\></code> between letters: <i>a b a b a b a b</i></p> <p>using <code>\;</code> between letters: <i>a b a b a b a b</i></p> <p>see also: \thinspace</p>																																								
<code>\</code> (backslash space)		control space; T_EX often ignores spaces, or collapses multiple spaces to a single space. A control space is used to force T_EX to typeset a space.	class ORD																																								
~ (tilde character)		In T_EX this is a non-breaking space—i.e., a blank space where T_EX is not allowed to break between lines. MathJax (unlike T_EX) doesn't do any automatic breaking of lines, so MathJax will not break at <i>any</i> space. The tilde is useful to force a space where MathJax would otherwise collapse or ignore spaces, as illustrated in the examples below.	class ORD																																								

		<p>Click here to see examples of what happens with very long math in MathJax.</p> <p>Examples:</p> <pre>\rm Dr. Carol J.V. Fisher</pre> yields $Dr. Carol J. V. Fisher$ <pre>\rm Dr.-Carol-J.V.-Fisher</pre> yields $Dr. Carol J. V. Fisher$ <pre>\text{Dr. Carol J.V. Fisher}</pre> yields $Dr. Carol J.V. Fisher$ <pre>a b c d</pre> yields $abcd$ <pre>a-b-----c-d</pre> yields $a b c d$ <p>in MathJax, this is the same as: \nobreakspace, \space, \ (backslash space)</p>
<code>\#</code>	#	<p>literal number sign; literal pound sign; Ⓔx0023; class ORD needed since # is used to indicate arguments in definitions</p>
<code>\\$</code>	\$	<p>literal dollar sign; needed since \$ may (optionally) be used to delimit math mode Ⓔx0024; class ORD</p> <p>Dollar sign outside of math mode: <input type="button" value="show/hide more info"/></p>
<code>\%</code>	%	<p>literal percent sign; needed since % is used to begin a single-line comment Ⓔx0025; class ORD</p>
<code>\&</code>	&	<p>literal ampersand; needed since ampersands are used as separators in alignment environments and for HTML entity references inside math mode Ⓔx0026; class ORD</p> <p>see also: \And</p>
<code>\%</code>		<p>line separator in alignment modes and environments</p> <p>Example:</p> $a \quad (23)$ <pre>\begin{gather}a\\a+b\\a+b+c\end{gather}</pre> yields $a + b \quad (24)$ $a + b + c \quad (25)$ <p>For a literal backslash, see \backslash.</p> <p>in MathJax, these are essentially the same: \cr \newline</p>
<code>_</code>	-	<p>literal underscore; needed since underscores are used for subscripts Ⓔx005F; class ORD</p> <p>Examples:</p> <pre>a_2</pre> yields a_2 <pre>a_2</pre> yields a_2
<code>\{ \}</code>	{ }	<p>literal braces; needed since braces are used for grouping in math mode; non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code> \{ is class OPEN \} is class CLOSE</p> <p>Examples:</p> <pre>{1,2,3}</pre> yields $1, 2, 3$ <pre>\{1,2,3\}</pre> yields $\{1, 2, 3\}$ <pre>\left\{\frac{ab,c}{b}\right\}</pre> yields $\left\{\frac{a}{b}, c\right\}$ <p>see also: \brace, \lbrace, \rbrace</p>
<code> </code>		<p>pipe character; vertical bar; absolute value; non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code> class ORD</p> <p>Examples:</p> <pre> x </pre> yields $ x $ <pre> \frac{ab} </pre> yields $\left \frac{a}{b}\right $ <pre>\left \frac{ab}{b}\right </pre> yields $\left \frac{a}{b}\right $ <pre>\{x x\in\Bbb Z\}</pre> yields $\{x x \in \mathbb{Z}\}$ <pre>\{x\,, \,x\in\Bbb Z\}</pre> yields $\{x x \in \mathbb{Z}\}$ <p>see also: \lvert, \rvert, \vert</p>
<code>\ </code>		<p>double pipe character; double vertical bar; norm; non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code> Ⓔx2225; class ORD</p> <p>Examples:</p> <pre>\ x\ </pre> yields $\ x\ $ <pre> \ frac{ab}\ </pre> yields $\ \frac{a}{b}\ $ <pre>\left\ \frac{ab}{b}\right\ </pre> yields $\ \frac{a}{b}\ $ <p>see also: \lVert, \rVert, \Vert</p>

()	()	<p>parentheses; non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code> (is class OPEN; is class CLOSE)</p> <p>Examples: <code>(\frac ab,c)</code> yields $(\frac{a}{b},c)$ <code>\left(\frac ab,c\right)</code> yields $(\frac{a}{b},c)$</p>
.	.	<p>period; decimal point class PUNCT</p> <p>In some math environments (but not all): With numbers on either side, there is no surrounding space: <code>3.14</code> yields 3.14 With non-numeric characters, there is a slight amount of space on right: <code>a.b</code> yields $a.b$ To suppress this space, enclose the '.' in braces: <code>a{.}b</code> yields $a.b$</p>
/	/	<p>forward slash; can be used to denote division class ORD</p> <p>Example: <code>a/b</code> yields a/b</p>
+	+	<p>plus symbol; e.g., used for addition class BIN</p> <p>Example: <code>a+b</code> yields $a + b$</p>
-	-	<p>minus symbol; e.g., used for subtraction class BIN</p> <p>Example: <code>a-b</code> yields $a - b$ <code>-b</code> yields $-b$ in most cases, proper spacing is achieved to denote an opposite <code>\text{first: } -a\star b</code> yields first: $-a \star b$ an unusual situation; spacing is not optimal <code>\text{first: } {-}a\star b</code> yields first: $-a \star b$ in such cases, you can put the minus sign (or, the group <code>-a</code>) inside braces to suppress extra space</p>
[]	[]	<p>(square) brackets; non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code> (is class OPEN; is class CLOSE)</p> <p>Examples: <code>[\frac ab,c]</code> yields $[\frac{a}{b},c]$ <code>\left[\frac ab,c\right]</code> yields $[\frac{a}{b},c]$</p> <p>see also: \brack, \lbrack, \rbrack</p>
=	=	<p>equal; equals class REL</p> <p>see also: \ne, \neq</p>
'	'	<p>prime symbol class ORD</p> <p>Example: <code>f(x) = x^2,\</code> <code>f'(x) = 2x,\</code> yields $f(x) = x^2, f'(x) = 2x, f''(x) = 2$ <code>f''(x) = 2</code></p> <p>see also: \prime</p>

A

<code>\above</code>		<p>general command for making fractions; gives control over thickness of horizontal fraction bar</p> $\{ <subformula1> \above <dimen> <subformula2> \}$ <p>Creates a fraction: numerator: <code>subformula1</code> denominator: <code>subformula2</code> fraction bar has thickness: dimen</p> <p>There are separate local groups for <code>subformula1</code> and <code>subformula2</code>; if these local groups are not explicit, then unexpected results may occur, as illustrated in the choose discussion.</p> <p>Examples: <code>a+1 \above 1pt b</code> yields $\frac{a+1}{b}$ <code>a \above 1pt b+2</code> yields $\frac{a}{b+2}$</p>
---------------------	--	--

		$\{a+1 \text{ \above 1.5pt } b+2\}+c$ yields $\frac{a+1}{b+2} + c$ see also: \abovewithdelims , \atop , \atopwithdelims , \cffrac , \dffrac , \frac , \genfrac , \over , \overwithdelims
<code>\abovewithdelims</code>		general command for making fractions; gives control over thickness of horizontal fraction bar; specifies left and right enclosing delimiters $\{ <subformula1> \abovewithdelims <delim1> <delim2> <dimen> <subformula2> \}$ Creates a fraction: numerator: <code>subformula1</code> denominator: <code>subformula2</code> fraction bar has thickness: <code>dimen</code> <code>delim1</code> is put before the fraction <code>delim2</code> is put after the fraction For an empty delimiter, use '.' in place of the delimiter. There are separate local groups for <code>subformula1</code> and <code>subformula2</code> ; if these local groups are not explicit, then unexpected results may occur, as illustrated in the choose discussion. Examples: $a+1 \text{ \abovewithdelims [] 1pt } b$ yields $\left[\frac{a+1}{b} \right]$ $\{a \text{ \abovewithdelims . 1.5pt } b+2\}_{a=3}$ yields $\frac{a}{b+2} \Big _{a=3}$ $\{a+1 \text{ \abovewithdelims \{ \} 1pt } b+2\}+c$ yields $\left\{ \frac{a+1}{b+2} \right\} + c$ see also: \above , \atop , \atopwithdelims , \cffrac , \dffrac , \frac , \genfrac , \over , \overwithdelims
<code>\acute</code>	´	$\&\#x02CA;$ acute accent $\acute \#1$ Usually, #1 is a single letter; otherwise, accent is centered over argument. Examples: $\acute e$ yields \acute{e} $\acute E$ yields \acute{E} $\acute eu$ yields \acute{eu} \acute{eu} yields \acute{eu}
<code>\aleph</code>	ℵ	Hebrew letter aleph; $\&\#x2135;$ class ORD commonly used for the cardinality of the real numbers
<code>\alpha</code>	α	lowercase Greek letter alpha $\&\#x03B1;$ class ORD
<code>\amalg</code>	⊎	this symbol is often used for co-products $\&\#x2A3F;$ class BIN
<code>\And</code>	&	ampersand $\&\#x0026;$ class ORD see also: \&
<code>\angle</code>	∠	$\&\#x2220;$ class ORD
<code>\approx</code>	≈	$\&\#x2248;$ class REL
<code>\approxeq</code> <small>AMSsymbols</small>	≈	$\&\#x224A;$ class REL
<code>\arccos</code>	arccos	does not change size; class OP default limit placement is the same in both inline and display modes; can change limit placement using \limits ; see the Big Operators Table for examples If alternate notation is desired, define: $\def\arccosAlt{\cos^{-1}}$ so that $\arccosAlt(x)$ yields $\cos^{-1}(x)$
<code>\arcsin</code>	arcsin	does not change size; class OP default limit placement is the same in both inline and display modes; can change limit placement using \limits ; see the Big Operators Table for examples If alternate notation is desired, define: $\def\arcsinAlt{\sin^{-1}}$ so that $\arcsinAlt(x)$ yields $\sin^{-1}(x)$
<code>\arctan</code>	arctan	does not change size; class OP default limit placement is the same in both inline and display modes; can change limit placement using \limits ; see the Big Operators Table for examples If alternate notation is desired, define: $\def\arctanAlt{\tan^{-1}}$ so that $\arctanAlt(x)$ yields $\tan^{-1}(x)$
<code>\arg</code>	arg	the complex argument function; class OP does not change size; default limit placement is the same in both inline and display modes; can change limit placement using \limits ; see the Big Operators Table for examples
<code>\array</code>		a synonym for <code>\matrix</code> $\array{ <math> \& <math> \dots \cr <repeat as needed> }$ alignment occurs at the ampersands;

		<p>a double-backslash can be used in place of the <code>\cr</code> ; the final <code>\\</code> or <code>\cr</code> is optional</p> <p>Example:</p> $\array{ a & b+1 \cr c+1 & d }$ yields $\begin{matrix} a & b+1 \\ c+1 & d \end{matrix}$ <p>see also: \matrix</p>
<code>\arrowvert</code>		<p>not intended for direct use; Ⓔx23D0; class ORD used internally to create stretchy delimiters</p> <p>see also: ↓, \vert, \lvert, \rvert,</p>
<code>\Arrowvert</code>		<p>not intended for direct use; Ⓔx2016; class PUNCT used internally to create stretchy delimiters</p> <p>see also: \ , \Vert, \lVert, \rVert</p>
<code>\ast</code>	*	<p>asterisk Ⓔx2217; class BIN</p>
<code>\asymp</code>	≈	<p>asymptotic Ⓔx224D; class REL</p>
<code>\atop</code>		<p>general command for making a fraction-like structure, but without the horizontal fraction bar</p> $\{ <subformula1> \atop <subformula2> \}$ <p>Creates a fraction-like structure: 'numerator' <code>subformula1</code> 'denominator' <code>subformula2</code></p> <p>There are separate local groups for <code>subformula1</code> and <code>subformula2</code> ; if these local groups are not explicit, then unexpected results may occur, as illustrated in the choose discussion.</p> <p>Examples:</p> $a \atop b \quad \text{yields} \quad \frac{a}{b}$ $a+1 \atop b+2 \quad \text{yields} \quad \frac{a+1}{b+2}$ $\{a+1 \atop b+2\}+c \quad \text{yields} \quad \frac{a+1}{b+2} + c$ <p>see also: \above, \abovewithdelims, \atopwithdelims, \cfrac, \dfrac, \frac, \genfrac, \over, \overwithdelims</p>
<code>\atopwithdelims</code>		<p>general command for making a fraction-like structure, but without the horizontal fraction bar; specifies left and right enclosing delimiters</p> $\{ <subformula1> \atopwithdelims <delim1> <delim2> <subformula2> \}$ <p>Creates a fraction-like structure: 'numerator' <code>subformula1</code> 'denominator' <code>subformula2</code> <code>delim1</code> is put before the structure <code>delim2</code> is put after the structure For an empty delimiter, use <code>'</code> in place of the delimiter.</p> <p>There are separate local groups for <code>subformula1</code> and <code>subformula2</code> ; if these local groups are not explicit, then unexpected results may occur, as illustrated in the choose discussion.</p> <p>Examples:</p> $a \atopwithdelims [] b \quad \text{yields} \quad \left[\frac{a}{b} \right]$ $a+1 \atopwithdelims . b+2 \quad \text{yields} \quad \frac{a+1}{b+2} $ $\{a+1 \atopwithdelims \{ \} b+2\}+c \quad \text{yields} \quad \left\{ \frac{a+1}{b+2} \right\} + c$ <p>see also: \above, \abovewithdelims, \atop, \cfrac, \dfrac, \frac, \genfrac, \over, \overwithdelims</p>

B

<code>\backepsilon</code>	AMSsymbols	ϵ	Ⓔx220D; class REL
<code>\backprime</code>	AMSsymbols	′	see also: \prime Ⓔx2035; class ORD
<code>\backsim</code>	AMSsymbols	∼	Ⓔx223D; class REL
<code>\backsimeq</code>	AMSsymbols	⋈	Ⓔx22C0; class REL

<code>\bmod</code>		mod	properly spaced as a binary operator	class BIN
<code>\boldsymbol</code>			as opposed to \bf and \mathbf , <code>\boldsymbol</code> applies to nearly <i>all</i> symbols, not just letters and numbers $\backslash\boldsymbol{\#1}$ Examples: $\backslash\boldsymbol{aa}$ yields aa $\backslash\boldsymbol{\alpha\alpha}$ yields αα $\backslash\boldsymbol{a\alpha a\alpha}$ yields aαaα $\backslash\boldsymbol{a+2\alpha+\frac{x+3}{\beta+4}}$ yields a + 2 + α + $\frac{x+3}{\beta+4}$ $\backslash\mathbf{a+2\alpha+\frac{x+3}{\beta+4}}$ yields a + 2 + α + $\frac{x+3}{\beta+4}$ see also: \bf , \mathbf	class ORD
<code>\bot</code>		⊥		℄#x22A5; class ORD
<code>\bowtie</code>		⋈		℄#x22C8; class REL
<code>\Box</code>	AMSsymbols	□		℄#x25A1; class ORD
<code>\boxdot</code>	AMSsymbols	◻		℄#x22A1; class BIN
<code>\boxed</code>	AMSmath		puts a box around argument; argument is in math mode $\backslash\boxed{\#1}$ Examples: $\backslash\boxed{ab}$ yields \boxed{ab} $\backslash\boxed{ab}$ yields \boxed{ab} $\backslash\boxed{ab\strut}$ yields \boxed{ab} $\backslash\boxed{\text{boxed text}}$ yields $\boxed{\text{boxed text}}$ see also: \fbox	
<code>\boxminus</code>	AMSsymbols	⊖		℄#x229F; class BIN
<code>\boxplus</code>	AMSsymbols	⊕		℄#x229E; class BIN
<code>\boxtimes</code>	AMSsymbols	⊗		℄#x22A0; class BIN
<code>\brace</code>			creates a braced structure $\{ \langle\text{subformula1}\rangle \backslash\brace \langle\text{subformula2}\rangle \}$ Examples:	

		\backslash brace yields $\{ \}$ $a\backslash$ brace b yields $\{a\}$ $a+b+c\backslash$ brace $d+e+f$ yields $\{a+b+c\}$ $a+\{b+c\backslash$ brace $d+e\}+f$ yields $a + \{b+c\}$ $d+e\} + f$	
\backslash bracevert		not intended for direct use; used internally to create stretchy delimiters	⎪ class ORD
\backslash brack		creates a bracketed structure $\{ <subformula1> \backslash$ brack $<subformula2> \}$ Examples: \backslash brack yields \square $a\backslash$ brack b yields $\left[a \right]$ $a+b+c\backslash$ brack $d+e+f$ yields $\left[a+b+c \right]$ $a+\{b+c\backslash$ brack $d+e\}+f$ yields $a + \left[b+c \right]$ $d+e\} + f$	
\backslash breve	◌̆	breve accent \backslash breve #1 Usually, #1 is a single letter; otherwise, accent is centered over argument. Examples: \backslash breve e yields $\text{e}̆$ \backslash breve E yields $\text{E}̆$ \backslash breve eu yields $\text{eu}̆$ \backslash breve{eu} yields $\text{eu}̆$	˘
\backslash buildrel ... \backslash over ...		\backslash buildrel $<subformula1> \backslash$ over #1 The result is of class REL (binary relation), so it has the spacing of a relation. Examples: \backslash buildrel $\alpha\backslash$ beta \backslash over \backslash longrightarrow yields $\xrightarrow{\alpha\beta}$ \backslash buildrel \backslash rm def \backslash over $\{:=\}$ yields $\stackrel{\text{def}}{:=}$	
\backslash bullet	•		∙ class BIN
\backslash Bumpeq	AMSsymbols	\approx	≎ class REL
\backslash bumpeq	AMSsymbols	\approx	≏ class REL

C

\backslash cal		class ORD turns on calligraphic mode; only affects uppercase letters and digits $\{ \backslash$ cal ... $\}$ Examples: \backslash cal ABCDEFGHIJKLMNOPQRSTUVWXYZ yields <i>ABCDEFGHIJKLMN^OPQRSTU^VW^XYZ</i> \backslash cal 0123456789 yields <i>0123456789</i> \backslash cal abcdefghijklmnopqrstuvwxyz yields <i>abcdefghijklmnopqrstu^vwxyz</i> \backslash cal ABCDEFGHIJKLMNOPQRSTUVWXYZ yields <i>abcdefghijklmnopqrstu^vwxyz</i> $\{ \backslash$ cal AB $\}$ AB yields <i>ABAB</i> \backslash cal AB \backslash rm AB yields <i>ABAB</i> \backslash cal{AB}CD yields <i>ABCD</i> see also: \oldstyle , \mathcal	
\backslash cancel		Used to ‘cancel’ (strikeout). \backslash cancel #1 \backslash bcancel #1 Examples: \backslash frac{(x+1)\cancel{(x+2)}}{3\cancel{(x+2)}} yields $\frac{(x+1)\cancel{(x+2)}}{3\cancel{(x+2)}}$ \backslash frac{\bcancel{\frac{1}{3}}}{\bcancel{\frac{1}{3}}} = 1 yields $\frac{\cancel{\frac{1}{3}}}{\cancel{\frac{1}{3}}} = 1$	
\backslash Cap	AMSsymbols	⏏	⋒ class BIN see also: \bigcap , \cap , \Cup , \cup , \doublecap , \doublecup

<code>\cap</code>		\cap $\&\#x2229$; class BIN see also: \bigcap , \Cap , \Cup , \cup , \doublecap , \doublecup
<code>\cases</code>		class OPEN for piecewise-defined functions $\backslash\cases{ <math> \& <math> \backslashcr <repeat\ as\ needed> }$ a double-backslash can be used in place of <code>\cr</code> ; the final <code>\</code> or <code>\cr</code> is optional In T_EX , the second column is automatically in text-mode, while in MathJax it is in math-mode. This behavior will be changed to be consistent with T_EX in a future release of MathJax. Example: <pre> x = \cases{ x & \text{if } x\ge 0\cr -x & \text{if } x< 0 }</pre> yields $ x = \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0 \end{cases}$
<code>\cdot</code>		\cdot $\&\#x22C5$; class BIN centered dot Examples: <code>a\cdot b</code> yields $a \cdot b$ <code>a\cdottp b</code> yields $a \cdot b$ <code>a\centerdot b</code> yields $a \cdot b$ see also: \cdottp , \cdots , \centerdot
<code>\cdotp</code>		\cdot $\&\#x22C5$; class PUNCT centered dot, punctuation symbol Examples: <code>\rm s \cdot h</code> yields $s \cdot h$ <code>\rm s \cdottp h</code> yields $s \cdot h$ see also: \cdot , \centerdot
<code>\cdots</code>		\cdots $\&\#x22EF$; class INNER centered dots; dot dot dot Example: <code>x_1 + \cdots + x_n</code> yields $x_1 + \cdots + x_n$ see also: \dots , \ldots
<code>\centerdot</code>	AMSSymbols	\cdot $\&\#x22C5$; class BIN centered dot Examples: <code>a\cdot b</code> yields $a \cdot b$ <code>a\cdottp b</code> yields $a \cdot b$ <code>a\centerdot b</code> yields $a \cdot b$ see also: \cdot , \cdottp
<code>\cfrac</code>	AMSmath	use for continued fractions $\backslash\cfrac \#1 \#2$ Examples: <code>\frac{2}{1+\frac{2}{1+\frac{2}{1}}}</code> yields $\frac{2}{1+\frac{2}{1+\frac{2}{1}}}$ <code>\cfrac{2}{1+\cfrac{2}{1+\cfrac{2}{1}}}</code> yields $1 + \frac{2}{1 + \frac{2}{1}}$ see also: \above , \abovewithdelims , \atop , \atopwithdelims , \dfrac , \frac , \genfrac , \over , \overwithdelims
<code>\check</code>		\checkmark $\&\#x02C7$; check accent $\backslash\check \#1$ Usually, #1 is a single letter; otherwise, accent is centered over argument. Examples: <code>\check o</code> yields \check{o} <code>\check O</code> yields \check{O} <code>\check oe</code> yields \check{oe} <code>\check{oe}</code> yields \check{oe}
<code>\checkmark</code>	AMSSymbols	\checkmark $\#x2713$; class ORD
<code>\chi</code>		χ $\&\#x03C7$; class ORD lowercase Greek letter chi

\backslash choose		<p>notation commonly used for binomial coefficients; different versions for inline and display modes</p> $\{ \langle \text{subformula1} \rangle \backslash \text{choose} \langle \text{subformula2} \rangle \}$ <p>There are separate local groups for <code>subformula1</code> and <code>subformula2</code>; if these local groups are not explicit, then unexpected results may occur, as illustrated next.</p> <p>Examples (showing the math delimiters):</p> <pre> $\\$ \backslash \text{displaystyle} \{ n+1 \} \backslash \text{choose} \{ k+2 \} \\$ </pre> <p>yields $\binom{n+1}{k+2}$</p> <p>Without an explicit braced group, the local group for <code>subformula1</code> extends back to the opening math delimiter. That is, this code is interpreted as (color added for emphasis): $\\$ \{ \backslash \text{displaystyle} \{ n+1 \} \} \backslash \text{choose} \{ k+2 \} \\$. Now it is clear that only the <code>n+1</code> is affected by the <code>\displaystyle</code> switch.</p> <pre> $\\$ \backslash \text{displaystyle} \{ \{ n+1 \} \backslash \text{choose} \{ k+2 \} \} \\$ </pre> <p>yields $\binom{n+1}{k+2}$</p> <p>Here, an explicit braced group is used for the <code>\choose</code> command, making both subformulas clear—and the expected result is obtained. Note that it may appear that <code>\displaystyle</code> is taking an argument, but this is not the case: instead, <code>\displaystyle</code> acts as a switch which turns on display mode, and the entire <code>choose</code> command is affected.</p> <p>Examples (showing math delimiters):</p> $\$ n+1 \backslash \text{choose} k+2 \$ \text{ yields } \binom{n+1}{k+2}$ $\$ \$ n+1 \backslash \text{choose} k+2 \$ \$ \text{ yields } \binom{n+1}{k+1}$ $\$ 1 + \{ n \backslash \text{choose} 2 \} + k \$ \text{ yields } 1 + \binom{n}{2} + k$ <p>see also: \binom, \dbinom, \tbinom</p>
\backslash circ		$\&\#x2218$; class BIN
\backslash circeq		$\&\#x2257$; class REL
\backslash circlearrowleft \backslash circlearrowright	 	$\&\#x21BA$; counterclockwise class REL $\&\#x21BB$; clockwise class REL
\backslash circledast \backslash circledcirc \backslash circleddash	  	$\&\#x229B$; circled asterisk class BIN $\&\#x229A$; circled circle class BIN $\&\#x229D$; circled dash class BIN
\backslash circledR \backslash circledS	 	$\&\#x00AE$; circled R class ORD $\&\#x24C8$; circled S class ORD
\backslash class [HTML]		<p>non-standard; extension is loaded automatically when used; used to specify a CSS class for styling mathematics</p> $\backslash \text{class} \#1 \#2$ <p>where:</p> <ul style="list-style-type: none"> • <code>#1</code> is a CSS class name (without quotes) • <code>#2</code> is the mathematics to be styled <p>Example: Suppose this CSS style information is provided outside of math mode:</p> <pre> <style type="text/css"> .smHighlightRed { font-size:small; background-color:yellow; color:red; } </style> </pre> <p>Then,</p> $ab \backslash \text{class} \{ \text{smHighlightRed} \} \{ cdef \} gh \text{ yields } ab \text{cdef}gh$
\backslash clubsuit		$\&\#x2663$; class ORD see also: \diamondsuit , \heartsuit , \spadesuit
\backslash colon		$\&\#x003A$; class PUNCT a colon, treated as a punctuation mark (instead of a relation)
		<p>Examples:</p> $f: A \text{to} B \text{ yields } f: A \rightarrow B$ $f \backslash \text{colon} A \text{to} B \text{ yields } f: A \rightarrow B$

<code>\color</code>		used to specify a color in mathematics <code>\color #1 #2</code> where: #1 is the desired color #2 is the mathematics to be colored This works differently from standard L^AT_EX (where <code>\color</code> is a switch). In a future version of MathJax, it will be possible to load an extension to make the command behave like the L^AT_EX version. Examples: <code>\color{red}{\frac{1+\sqrt{5}}{2}}</code> yields $\frac{1+\sqrt{5}}{2}$ <code>\color{#0000FF}AB</code> yields AB
<code>\complement</code> AMSSymbols	\complement	<code>\complement</code> ; class ORD

\dffrac AMSmath		<p>fractions;</p> <p>display version (in both inline and display modes)</p> <p style="text-align: right;"><code>\dffrac #1 #2</code></p> <p>Examples:</p> <p><code>\dffrac a b</code> yields (inline mode) $\frac{a}{b}$</p> <p><code>\dffrac a b</code> yields (display mode) $\frac{a}{b}$</p> <p><code>\frac a b</code> yields (inline mode) $\frac{a}{b}$</p> <p><code>\dffrac{a-1}b-1</code> yields $\frac{a-1}{b} - 1$</p> <p><code>\dffrac{a-1}{b-1}</code> yields $\frac{a-1}{b-1}$</p> <p>see also: \above, \abovewithdelims, \atop, \atopwithdelims, \cfrac, \frac, \genfrac, \over, \overwithdelims</p>
\diagdown \diagup	<p>AMSSymbols \diagdown</p> <p>AMSSymbols \diagup</p>	<p><code>&#x2572;</code> diagonal down (from left to right) class ORD</p> <p><code>&#x2571;</code> diagonal up (from left to right) class ORD</p>
\Diamond \diamond	<p>AMSSymbols \Diamond</p> <p>\diamond</p>	<p><code>&#x25CA;</code> large diamond class ORD</p> <p><code>&#x22C4;</code> small diamond class BIN</p>
\diamondsuit	\diamondsuit	<p><code>&#x2662;</code> class ORD</p> <p>see also: \clubsuit, \heartsuit, \spadesuit</p>
\digamma	AMSSymbols \digamma	<p><code>&#x03DD;</code> class ORD</p>
\dim	dim	<p>class OP</p> <p>dimension;</p> <p>does not change size;</p> <p>default limit placement is the same in both inline and display modes;</p> <p>can change limit placement using \limits;</p> <p>see the Big Operators Table for examples</p>
\displaylines		<p>to display any number of centered formulas (without any alignment)</p> <p style="text-align: center;"><code>\displaylines{ <math> \cr <repeat as needed> }</code></p> <p>a double-backslash can be used in place of the <code>\cr</code>;</p> <p>the final <code>\\</code> or <code>\cr</code> is optional</p> <p>Example:</p> <p><code>\displaylines{ a = a\\ \text{if } a=b \text{ then } b=a\\ \text{if } a=b \text{ and } b=c \text{ then } a=c }</code> yields $\begin{array}{l} a = a \\ \text{if } a = b \text{ then } b = a \\ \text{if } a = b \text{ and } b = c \text{ then } a = c \end{array}$</p> <p>see also: gather</p>
\displaystyle		<p>class ORD</p> <p>used to over-ride automatic style rules and force display style;</p> <p>stays in force until the end of math mode or the braced group, or until another style is selected</p> <p style="text-align: center;"><code>{ \displaystyle ... }</code></p> <p>Example:</p> <p>In inline mode:</p> <p><code>\frac ab+\displaystyle\frac ab+\textstyle\frac ab</code> <code>+\scriptstyle\frac ab+\scriptscriptstyle\frac ab</code> yields:</p> $\frac{a}{b} + \frac{a}{b} + \frac{a}{b} + \frac{a}{b} + \frac{a}{b}$ <p>Example:</p> <p>In inline mode:</p> <p><code>\frac ab + {\displaystyle \frac cd + \frac ef} + \frac gh</code> yields</p> $\frac{a}{b} + \frac{c}{d} + \frac{e}{f} + \frac{g}{h}$

		<p>Example: In inline mode: $\frac{a}{b} + \frac{c}{d} + \frac{e}{f} + \frac{g}{h}$ yields $\frac{a}{b} + \frac{c}{d} + \frac{e}{f} + \frac{g}{h}$</p> <p>see also: \textstyle, \scriptstyle, \scriptscriptstyle</p>
<code>\div</code>	\div	$\&\#x00F7$; class BIN division symbol
<code>\divideontimes</code> AMSSymbols	\ast	$\&\#x22C7$; class BIN
<code>\Doteq</code> AMSSymbols <code>\doteq</code>	\doteq \doteq	$\&\#x2251$; class REL $\&\#x2250$; class REL
<code>\dotplus</code> AMSSymbols	$\dot{+}$	$\&\#x2214$; class BIN
<code>\dots</code>	\dots	$\&\#x2026$; class INNER lower dots; ellipsis; ellipses; dot dot dot In L^AT_EX , <code>\dots</code> chooses either <code>\cdots</code> or <code>\ldots</code> depending on the context; MathJax, however, always gives lower dots. Examples: x_1, \dots, x_n yields x_1, \dots, x_n $x_1 + \dots + x_n$ yields $x_1 + \dots + x_n$ $x_1 + \dotsb + x_n$ yields $x_1 + \dots + x_n$ $x_1 + \cdots + x_n$ yields $x_1 + \dots + x_n$
<code>\dotsb</code> <code>\dotsc</code> <code>\dotsi</code> <code>\dotsm</code> <code>\dotso</code>		$\&\#x22EF$; <code>\dotsb</code> class INNER dots with binary operations and relations $x_1 + x_2 + \dots + x_n$ $\&\#x2026$; <code>\dotsc</code> class INNER dots with commas x_1, x_2, \dots, x_n $\&\#x22EF$; <code>\dotsi</code> class INNER dots with integrals $\int_{A_1} \int_{A_2} \dots \int_{A_n}$ $\&\#x22EF$; <code>\dotsm</code> class INNER dots with multiplication $x_1 x_2 \dots x_n$ $\&\#x2026$; <code>\dotso</code> class INNER other dots $A_1 \dots A_n$
<code>\doublebarwedge</code> AMSSymbols	$\overline{\wedge}$	$\&\#x2A5E$; BIN
<code>\doublecap</code> AMSSymbols <code>\doublecup</code> AMSSymbols	$\overline{\cap}$ $\overline{\cup}$	$\&\#x22D2$; class BIN $\&\#x22D3$; class BIN see also: \Cap , \Cup , \cap , \cup
<code>\downarrow</code> <code>\Downarrow</code>	\downarrow \Downarrow	$\&\#x2193$; down arrow; non-stretchy class REL $\&\#x21D3$; double down arrow; non-stretchy class REL
<code>\downdownarrows</code> AMSSymbols	\Downarrow	$\&\#x21CA$; class REL down down arrows; non-stretchy
<code>\downharpoonleft</code> AMSSymbols <code>\downharpoonright</code> AMSSymbols	\harpoonleft \harpoonright	$\&\#x21C3$; down harpoon left; non-stretchy class REL $\&\#x21C2$; down harpoon right; non-stretchy class REL see also: \leftharpoondown , \leftharpoonup

E

<code>\ell</code>	ℓ	$\&\#x2113$; class ORD
<code>\emptyset</code>	\emptyset	$\&\#x2205$; class ORD empty set see also: \varnothing
<code>\end</code>		used in \begin{xxx} ... \end{xxx} environments
<code>\enspace</code>		<code>\enspace</code> is a 0.5em space Example: $ \enspace \enspace $ yields $ \enspace \enspace $
<code>\epsilon</code>	ϵ	$\&\#x03F5$; class ORD lowercase Greek letter epsilon see also: \varepsilon
<code>\eqalign</code>		equation alignment; for aligning multi-line displays at a single place $\eqalign{ <math> \& <math> \cr <repeat as needed> }$ the ampersand is placed where alignment is desired; a double-backslash can be used in place of the <code>\cr</code> ; the final <code>\</code> or <code>\cr</code> is optional; supports only a single <code>\tag</code> , which is vertically centered Example:

		<pre>\eqalign{ 3x - 4y &= 5\cr x + 7 &= -2y }</pre> <p>yields:</p> $\begin{aligned} 3x - 4y &= 5 \\ x + 7 &= -2y \end{aligned}$ <p>Example: A <code><math></code> component may be empty:</p> <pre>\eqalign{ (a+b)^2 &= (a+b)(a+b) \\ &= a^2 + ab + ba + b^2 \\ &= a^2 + 2ab + b^2 }</pre> <p>yields:</p> $\begin{aligned} (a + b)^2 &= (a + b)(a + b) \\ &= a^2 + ab + ba + b^2 \\ &= a^2 + 2ab + b^2 \end{aligned}$ <p>Example: The result of <code>\eqalign</code> is a vertically-centered block; you can use more than one in the same display:</p> <pre>\left\{ \eqalign{ a &= 1 \\ b &= 2 \\ c &= 3 }\right\} \quad \eqalign{ ax + by &= c \\ x + 2y &= 3 }</pre> <p>yields:</p> $\left\{ \begin{array}{l} a = 1 \\ b = 2 \\ c = 3 \end{array} \right\} \quad \begin{array}{l} ax + by = c \\ x + 2y = 3 \end{array}$ <p>see also: \eqalignno, the align environment, \tag</p>
<code>\eqalignno</code>		<p>equation alignment with optionally numbered (tagged) lines</p> <pre>\eqalignno{ <math> & <math> & <equation tag> \cr <repeat as needed> }</pre> <p>the first ampersand is placed where alignment is desired; the second ampersand is used just before a tag; if there is no tag, then the final <code>& <equation tag></code> is omitted; a double-backslash can be used in place of the <code>\cr</code>; the final <code>\</code> or <code>\cr</code> is optional</p> <p>Example:</p> <pre>\eqalignno{ 3x - 4y &= 5 & (\dagger) \cr x + 7 &= -2y & (\ddagger) \cr z &= 2 }</pre> <p>yields:</p> $\begin{aligned} 3x - 4y &= 5 & (\dagger) \\ x + 7 &= -2y & (\ddagger) \\ z &= 2 \end{aligned}$ <p>see also: \eqalign, \eqalignno, the align environment</p>
<code>\eqcirc</code>	AMSsymbols	≡ &#x2256 ; class REL
<code>\eqsim</code>	AMSsymbols	≈ &#x2242 ; class REL
<code>\eqslantgtr</code>	AMSsymbols	≧ &##x2A96 ; class REL
<code>\eqslantless</code>	AMSsymbols	≦ &##x2A95 ; class REL
<code>\equiv</code>		≡ &#x2261 ; class REL
Error Messages; page processing log		<p>When you're working with a MathJax page, you may want to see the log of messages generated during page processing (particularly if something has gone wrong). To do this, type</p> <pre>javascript:alert(MathJax.Message.Log())</pre> <p>in the browser's location URL box, and then refresh the page. If the alert box is too big to see the close button, just press 'enter' to close the alert box.</p>
<code>\eta</code>		η &#x03B7 ; class ORD lowercase Greek letter eta
<code>\eth</code>	AMSsymbols	ð &#x00F0 ; class ORD
<code>\exists</code>		∃ &#x2203 ; class ORD there exists see also: \nexists

<code>\exp</code>	exp	class OP exponential function; does not change size; default limit placement is the same in both inline and display modes; can change limit placement using \limits ; see the Big Operators Table for examples
-------------------	---------------------	---

F

<code>\fallingdotseq</code> <small>AMSsymbols</small>		<code>&#x2252</code> ; class REL falling dot sequence; see also: \risingdotseq
<code>\fbox</code>		puts a box around argument; argument is in text mode equivalent to: <code>\boxed{\text{#1}}</code> $\fbox{#1}$ where #1 is rendered as text Examples: <code>\boxed{Hi there!}</code> yields  <code>\fbox{Hi there!}</code> yields  see also: \boxed
<code>\Finv</code> <small>AMSsymbols</small>		<code>&#x2132</code> ; class ORD
<code>\flat</code>		<code>&#x266D</code> ; class ORD musical flat symbol see also: \natural , \sharp
<code>\forall</code>		<code>&#x2200</code> ; class ORD universal quantifier; for all; for every; for each
<code>\frac</code> <small>AMSmath</small>		fractions; displays differently in inline and display modes $\frac{#1}{#2}$ Examples: <code>\frac a b</code> yields (inline mode) $\frac{a}{b}$ <code>\frac a b</code> yields (display mode) $\frac{a}{b}$ <code>\frac{a-1}{b-1}</code> yields $\frac{a-1}{b-1} - 1$ <code>\frac{a-1}{b-1}</code> yields $\frac{a-1}{b-1}$ see also: \above , \abovewithdelims , \atop , \atopwithdelims , \cfrac , \dfrac , \genfrac , \over , \overwithdelims
<code>\frak</code>		class ORD turns on fraktur; affects uppercase and lowercase letters, and digits $\{\frak \dots \}$ Examples: <code>\frak ABCDEFGHIJKLMNOPQRSTUVWXYZ</code> yields  <code>\frak 0123456789</code> yields  <code>\frak abcdefghijklmnopqrstuvwxyz</code> yields  <code>\frak AB</code> yields  <code>\frak AB \rm AB</code> yields  <code>\frak AB \cal AB</code> yields  see also: \mathfrak
<code>\frown</code>		<code>&#x2322</code> ; class REL see also: \smallfrown , \smallsmile , \smile

G

<code>\Game</code> <small>AMSsymbols</small>		<code>&#x2141</code> ; class ORD
<code>\Gamma</code>		<code>&#x0393</code> ; class ORD uppercase Greek letter gamma see also: \varGamma
<code>\gamma</code>		<code>&#x03B3</code> ; class ORD lowercase Greek letter gamma
<code>\gcd</code>	gcd	class OP greatest common divisor; does not change size; can change limit placement using \limits and \nolimits ; see the Big Operators Table for examples Examples: <code>\gcd_{\rm sub}^{\rm sup}</code> yields (inline mode) $\gcd_{\text{sub}}^{\text{sup}}$

		$\backslashgcd_{\rm sub}^{\rm sup}$ yields (display mode) \sup \gcd \sub
\backslashge \backslashgeq \backslashgeqq AMSsymbols \backslashgeqslant AMSsymbols	\geq \geq \geq \geq	$\&\#x2265;$ \backslashge $\&\#x2265;$ \backslashgeq $\&\#x2267;$ \backslashgeqq $\&\#x2A7E;$ \backslashgeqslant all class REL greater than or equal to see also: \ngeq , \ngeqq , \ngeqslant
\backslashgenfrac AMSmath		the most general command for defining fractions with optional delimiters, line thickness, and specified style $\backslashgenfrac \#1 \#2 \#3 \#4 \#5 \#6$ where: <ul style="list-style-type: none"> • #1 is the left delimiter (empty, for no left delimiter) • #2 is the right delimiter (empty, for no right delimiter) • #3 is the fraction bar thickness (set to 0pt to make it disappear) • #4 is either 0, 1, 2, or 3, where: <ul style="list-style-type: none"> ◦ 0 denotes \displaystyle ◦ 1 denotes \textstyle ◦ 2 denotes \scriptstyle ◦ 3 denotes \scriptscriptstyle • #5 is the numerator • #6 is the denominator Example: $\backslashgenfrac{1{0pt}{2}{a+b}{c+d}$ yields $\left(\begin{smallmatrix} a+b \\ c+d \end{smallmatrix}\right)$ see also: \above , \abovewithdelims , \atop , \atopwithdelims , \cfraction , \dfrac , \frac , \over , \overwithdelims
\backslashgets	\leftarrow	$\&\#x2190;$ class REL left arrow; non-stretchy
\backslashgg	\gg	$\&\#x226B;$ class REL
\backslashggg AMSsymbols \backslashgggtr AMSsymbols	\ggg \ggg	$\&\#x22D9;$ class REL $\&\#x22D9;$ class REL
\backslashgimel AMSsymbols	\beth	$\&\#x2137;$ class ORD Hebrew letter gimel
\backslashgtrapprox AMSsymbols \backslashgnapprox AMSsymbols	\gtrapprox \gtrapprox	$\&\#x2A86;$ class REL $\&\#x2A8A;$ class REL
\backslashgneq AMSsymbols \backslashgneqq AMSsymbols \backslashgvertneqq AMSsymbols	\gneq \gneq \gneq	$\&\#x2A88;$ class REL $\&\#x2269;$ class REL $\&\#x2269;$ class REL
\backslashgtrsim AMSsymbols \backslashgnsim AMSsymbols	\gtrsim \gtrsim	$\&\#x2273;$ class REL $\&\#x22E7;$ class REL
\backslashgrave	$\grave{}$	$\&\#x02CB;$ grave accent $\backslashgrave \#1$ Usually, #1 is a single letter; otherwise, accent is centered over argument. Examples: $\backslashgrave e$ yields \grave{e} $\backslashgrave E$ yields \grave{E} $\backslashgrave eu$ yields \grave{eu} $\backslashgrave\{eu\}$ yields \grave{eu}
\backslashgt	\gt	$\&\#x003E;$ class REL greater than see also: \ngtr
\backslashgtrdot AMSsymbols	\gtrdot	$\&\#x22D7;$ class REL
\backslashgtreqless AMSsymbols \backslashgtreqqless AMSsymbols	\gtreqless \gtreqless	$\&\#x22DB;$ class REL $\&\#x2A8C;$ class REL
\backslashgtrless AMSsymbols	\gtrless	$\&\#x2277;$ class REL

H

\backslashhat	$\hat{}$	$\&\#x02C8;$ non-stretchy hat accent $\backslashhat \#1$
-----------------	----------	--

		<p>Usually, #1 is a single letter; otherwise, accent is centered over argument.</p> <p>Examples: \hat{i} \hat{j} \hat{ab} \hat{ab}</p> <p>see also: \widehat</p>
<code>\hbar</code>	\hbar	$\&\#x210F$; class ORD Planck's constant
<code>\hbox</code>		class ORD horizontal box; contents are treated as text, but you can switch to math mode inside; text appears in <code>\rm</code> $\hbox{#1}$ <p>Examples:</p> $\hbox{\alpha a}$ yields αa $\hbox{This is a sentence.}$ yields This is a sentence. $\hbox{for all $x > 0$}$ yields for all $x > 0$ <p>in MathJax, these are essentially the same: \text, \mbox see also: \rm</p>
<code>\hdashline</code> <code>\hline</code>		works in many of the environments to create a horizontal line (<code>\hline</code>), or a horizontal dashed line (<code>\hdashline</code>) <p>Putting <code>\hdashline</code> or <code>\hline</code> first or last encases the entire structure (which is different from standard L^AT_EX behavior):</p> $\begin{matrix} \hdashline & & x_{11} & x_{12} \\ x_{11} \ \& \ x_{12} \ \backslash\backslash & & \\ x_{21} \ \& \ x_{22} \ \backslash\backslash & \text{yields} & x_{21} \ x_{22} \\ x_{31} \ \& \ x_{32} & & x_{31} \ x_{32} \\ \hdashline & & & \end{matrix}$ $\begin{matrix} x_{11} & x_{12} \\ x_{21} & x_{22} \\ x_{31} & x_{32} \\ \hline & & x_{31} & x_{32} \\ \end{matrix}$ <p>Putting <code>\hdashline</code> or <code>\hline</code> at the beginning of any subsequent row puts a line over that row:</p> $\begin{matrix} x_{11} & x_{12} \\ x_{21} & x_{22} \\ \hline & & x_{21} & x_{22} \\ x_{31} & x_{32} \\ \end{matrix}$ <p>You can combine effects, and put in struts (as desired) for additional vertical spacing:</p> $\begin{matrix} \hline & & x_{11} & x_{12} \\ x_{11} \ \& \ x_{12} \ \backslash\backslash & & \\ x_{21} \ \& \ x_{22} \ \backslash\backslash \ \text{strut} \ \backslash\backslash & \text{yields} & x_{21} \ x_{22} \\ \hdashline & & & \\ x_{31} \ \& \ x_{32} \ \backslash\backslash \ \text{strut} & & x_{31} \ x_{32} \\ \end{matrix}$
<code>\heartsuit</code>	\heartsuit	$\&\#x2661$; class ORD see also: \clubsuit , \diamondsuit , \spadesuit
<code>\hom</code>	hom	class OP homomorphism; does not change size; default limit placement is the same in both inline and display modes; can change limit placement using \limits ; see the Big Operators Table for examples
<code>\hookleftarrow</code> <code>\hookrightarrow</code>	\hookleftarrow \hookrightarrow	$\&\#x21A9$; non-stretchy $\&\#x21AA$; non-stretchy both class REL

\hphantom		<p>class ORD horizontal phantom</p> <p>Sometimes you want to <i>pretend</i> that something is there, for spacing reasons, but you don't want it to appear—you want it to be invisible—you want it to be a phantom.</p> <p>The box created by <code>\hphantom</code> has the width of its argument, but its height and depth are zero (so it doesn't contribute to any vertical spacing issues). In other words, <code>\hphantom</code> creates horizontal space equal to that produced by its argument, but doesn't create any vertical space.</p> <p style="text-align: center;"><code>\hphantom #1</code></p> <p>Example:</p> <pre>\begin{array}{l} \text{Side Angle Side} \\ \text{S}\hphantom{\text{ide}}\text{A}\hphantom{ngle}\text{S} \end{array}</pre> <p>yields</p> <p style="text-align: center;">Side Angle Side S A S</p> <p>see also: \phantom, \vphantom</p>
\href		<p>used to make a math object into a link</p> <p style="text-align: center;"><code>\href{ <url> } #1</code></p> <p>where the argument (#1) is the clickable area</p> <p>Example:</p> <pre>\href{http://www.onemathematicalcat.org}{M^{A^{T^H}}}</pre> <p>yields $M^{A^{T^H}}$</p>
\hskip		<p>horizontal glue; horizontal space; horizontal skipping;</p> <p style="text-align: center;"><code>\hskip <dimen></code></p> <p>Example:</p> <pre>w\hskip1em i\hskip2em d\hskip3em e\hskip4em r</pre> <p>yields</p> <p style="text-align: center;">$w \quad i \quad d \quad e \quad r$</p> <p>in MathJax, these all behave the same: \hspace, \kern, \mkern, \mskip, \mspace</p>
\hslash	AMSsymbols	<p>\hbar <code>&#x210F;</code> class ORD perhaps an alternative form of Planck's constant</p>
\hspace		<p>horizontal glue; horizontal space; horizontal skipping</p> <p style="text-align: center;"><code>\hspace <dimen></code></p> <p>Example:</p> <pre>s\hspace7ex k\hspace6ex i\hspace5ex n\hspace4ex n\hspace3ex i\hspace2ex e\hspace1ex r</pre> <p>yields</p> <p style="text-align: center;">$s \quad k \quad i \quad n \quad n \quad i \quad e \quad r$</p> <p>in MathJax, these all behave the same: \hskip, \kern, \mkern, \mskip, \mspace</p>
\Huge \huge		<p>both class ORD turns on huge mode and an even bigger Huge mode</p> <p style="text-align: center;"><code>{\Huge ... }</code> <code>{\huge ... }</code></p> <p>Examples:</p> <pre>\huge AaBb\alpha\beta123\frac{a}{b}\sqrt{x}</pre> <p>yields $AaBb\alpha\beta123\frac{a}{b}\sqrt{x}$</p> <pre>{\huge A B} A B</pre> <p>yields AB_{AB}</p> <pre>A\alpha\huge A\alpha\huge \Huge A\alpha</pre> <p>yields $A_\alpha A_\alpha A_\alpha$</p> <p>see also: \LARGE, \Large, \large</p>

I

\iddots	<p style="text-align: center;">⋯</p> <p style="text-align: center;">Not in MathJax Library</p>	<p>inner diagonal dots;</p> <p>This macro must be supplied by the user, if desired. Davide Cervone provided the code (given here) in the MathJax User Group.</p> <p>To use this macro, put the following definition in either inline or display mathematics:</p> <pre>\$ \def\iddots{ {\kern3mu\raise1mu{.}\kern3mu\raise6mu{.}\kern3mu\raise12mu{.}} \$</pre> <p>Then, in any subsequent mathematics:</p>
---------	--	--

		<p><code>\iddots</code> yields $\cdot\cdot\cdot$</p> <p>Instead of providing the definition inside math delimiters in the body, you can add the definition to your configuration using the <code>Macros</code> property of the <code>TeX</code> block:</p> <pre><script type="text/x-mathjax-config"> MathJax.Hub.Config({ TeX: { Macros: { iddots: "{\\kern3mu\\raise1mu{.}\\kern3mu\\raise6mu{.}\\kern3mu\\raise12mu{.}}" }}}); </script></pre>
<code>\iddotsint</code>	AMSmath	$\int \dots \int$ <p>class OP changes size; can change limit placement using \limits; see the Big Operators Table for examples</p>
<code>\iff</code>		\iff <p><code>&#x27FA</code>; with a thick space on both sides if and only if; is equivalent to; non-stretchy</p> <p>Example: <code>A\iff B</code> yields $A \iff B$</p>
<code>\iiint</code> <code>\iiiint</code> <code>\iint</code> <code>\int</code>	AMSmath	\iiiii \iiiii \iint \int <p>four occurrences of <code>&#x222B</code>; <code>&#x222D</code>; <code>&#x222C</code>; <code>&#x222B</code>; all class OP; see the Big Operators Table for examples</p> <p>Compare the different limit placements (both in display mode):</p> <p><code>\int_a^b</code> yields \int_a^b</p> <p><code>\intop_a^b</code> yields \intop_a^b</p> <p>see also: \intop</p>
<code>\intop</code>		\int <p><code>&#x222B</code>; (with movable limits) class OP See the Big Operators Table for examples. see also: \iiint, \iint, \int, \int</p>
<code>\Im</code>		\Im <p><code>&#x2111</code>; class ORD</p>
<code>\imath</code>		\imath <p><code>&#x0131</code>; class ORD a dotless ‘i’; better to use when accented</p> <p>Examples: <code>\hat i</code> yields \hat{i} <code>\hat\imath</code> yields $\hat{\imath}$</p> <p>see also: \imath</p>
<code>\impliedby</code>	AMSsymbols	\impliedby <p><code>&#x27F8</code>; with a thick space on both sides non-stretchy</p> <p>Example: <code>P\impliedby Q</code> yields $P \impliedby Q$</p>
<code>\implies</code>	AMSsymbols	\implies <p><code>&#x27F9</code>; with a thick space on both sides non-stretchy</p> <p>Example: <code>P\implies Q</code> yields $P \implies Q$</p>
<code>\in</code>		\in <p><code>&#x2208</code>; class REL is in; is an element of; indicates membership in a set; see also: \ni, \notin, \owns</p>
<code>\inf</code>		\inf <p>class OP infimum; least upper bound; does not change size; can change limit placement using \limits and \nolimits; see the Big Operators Table for examples</p> <p>Examples: <code>\inf_{\rm limit}</code> yields (inline mode) \inf_{limit} <code>\inf_{\rm limit}</code> yields (display mode) \inf_{limit}</p> <p>see also: \sup</p>
<code>\infty</code>		∞ <p><code>&#x221E</code>; class ORD infinity</p>

<code>\injlim</code>	AMSmath	injlim	class OP injective limit; does not change size; can change limit placement using \limits and \nolimits ; see the Big Operators Table for examples see also: \varinjlim
<code>\intercal</code>	AMSsymbols	\intercal	<code>&#x22BA</code> ; class BIN
<code>\iota</code>		ι	<code>&#x03B9</code> ; class ORD lowercase Greek letter iota
<code>\it</code>			class ORD turns on math italic mode; to return to math italic mode if it had been turned off $\{\it \dots\}$ Examples: <code>\{\bf ab \it ab\}</code> ab yields ababab <code>\rm for\ all\ {\it x}\ in\ \Bbb R</code> yields for all x in \mathbb{R} <code>\Delta\Gamma\Lambda\it{\Delta\Gamma\Lambda}</code> yields $\Delta\Gamma\Lambda\Delta\Gamma\Lambda$ see also: \mathit , \mit

J

<code>\jmath</code>		\jmath	<code>&#x0237</code> ; class ORD a dotless ‘j’; better to use when accented Examples: <code>\hat j</code> yields \hat{j} <code>\hat\jmath</code> yields $\hat{\jmath}$ see also: \imath
<code>\Join</code>	AMSsymbols	\Join	<code>&#x22C8</code> ; class REL

K

<code>\kappa</code>		κ	<code>&#x03BA</code> ; class ORD lowercase Greek letter kappa see also: \varkappa
<code>\ker</code>		\ker	class OP kernel; does not change size; default limit placement is the same in both inline and display modes; can change limit placement using \limits ; see the Big Operators Table for examples
<code>\kern</code>			to get a specified amount of horizontal space; a negative argument forces ‘backing up’, so items can overlap $\kern <dimen>$ Examples: <code> \kern 2ex \kern 2em \kern 2pt </code> yields <code>\rm I\kern -2.5pt R</code> yields R in MathJax, these all behave the same: \hskip , \hspace , \mkern , \mskip , \mspace

L

<code>\Lambda</code>		Λ	uppercase Greek letter lambda <code>&#x039B</code>; class ORD
<code>\lambda</code>		λ	lowercase Greek letter lambda <code>&#x03BB</code>; class ORD see also: \varLambda
<code>\land</code>		\land	logical AND <code>&#x2227</code>; class BIN see also: \lor , \wedge
<code>\langle</code>		\langle	left angle bracket; non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code> (see below) <code>&#x27E8</code>; class OPEN Example: <code>\left\langle \matrix{a & b \\ c & d} \right\rangle</code> yields $\left\langle \begin{matrix} a & b \\ c & d \end{matrix} \right\rangle$ see also: \rangle
<code>\LARGE</code> <code>\Large</code> <code>\large</code>			turns on large typestyles; affects all math all class ORD $\{\LARGE \dots\}$ $\{\Large \dots\}$ $\{\large \dots\}$ Examples:

		<p><code>\Large AaBb\alpha\beta123\frac ab</code> yields $AaBb\alpha\beta123\frac{a}{b}$</p> <p><code>{\Large A B} A B</code> yields $ABAB$</p> <p><code>AB \large AB \Large AB \LARGE AB</code> yields $ABABABAB$</p> <p><code>\Large{AB}CD</code> yields $ABCD$</p> <p>see also: \huge, \Huge</p>
<code>\LaTeX</code>	\LaTeX	<p>the LaTeX logo class ORD</p> <p>Example: <code>\rm\LaTeX</code> yields \LaTeX</p> <p>see also: \TeX</p>
<code>\lbrace</code>	{	<p>left brace: class OPEN non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code> (see below)</p> <p>Examples:</p> <p><code>\lbrace \frac ab, c \rbrace</code> yields $\{\frac{a}{b}, c\}$</p> <p><code>\left\lbrace \frac ab, c \right\rbrace</code> yields $\left\{\frac{a}{b}, c\right\}$</p> <p>see also: \rbrace, \f\}</p>
<code>\lbrack</code>	[<p>left bracket: class OPEN non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code> (see below);</p> <p>Examples:</p> <p><code>\lbrack \frac ab, c \rbrack</code> yields $[\frac{a}{b}, c]$</p> <p><code>\left\lbrack \frac ab, c \right\rbrack</code> yields $\left[\frac{a}{b}, c\right]$</p> <p>see also: \rbrack, \l</p>
<code>\lceil</code>	⌈	<p>left ceiling; &#x2308; class OPEN non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code> (see below)</p> <p>Example:</p> <p><code>\left\lceil \matrix{a & b \\ c & d} \right\rceil</code> yields $\left[\begin{matrix} a & b \\ c & d \end{matrix}\right]$</p> <p>see also: \rceil, \lfloor, \rfloor</p>
<code>\ldotp</code>	.	<p>lower dot, punctuation symbol &#x002E; class PUNCT</p> <p>Examples:</p> <p><code>\rm s \ldotp h</code> yields $s.h$</p> <p><code>\rm s.h</code> yields $s.h$</p> <p>see also: \cdotp</p>
<code>\ldots</code>	⋯	<p>lower dots; ellipsis; ellipses; dot dot dot &#x2026; class INNER</p> <p>Example: <code>x_1, \ldots, x_n</code> yields x_1, \dots, x_n</p> <p>see also: \cdots, \dots</p>
<code>\le</code> <code>\leq</code> <code>\leqq</code> AMStools <code>\leqslant</code> AMStools	\leq \leq \leqq \leqslant	<p>less than or equal to &#x2264; class REL</p> <p>less than or equal to &#x2264; class REL</p> <p>less than or equal to &#x2266; class REL</p> <p>less than or equal to &#x2A7D; class REL</p> <p>see also: \nleq, \nleqq, \nleqslant</p>
<code>\leadsto</code> AMStools	\rightsquigarrow	<p>&#x21D0; class REL</p>
<code>\left</code>		<p>used for stretchy delimiters; see the Variable-Sized Delimiters Table for details</p> <p>Examples:</p> <p><code>\left(\frac 12 \right)</code> yields $\left(\frac{1}{2}\right)$</p> <p><code>\left\updownarrow \right\updownarrow</code> yields $\updownarrow \updownarrow$</p> <p>see also: \right</p>
<code>\leftarrow</code> <code>\Leftarrow</code>	\leftarrow \Leftarrow	<p>left arrow; non-stretchy &#x2190; class REL</p> <p>left arrow; non-stretchy &#x21D0; class REL</p> <p>see also: \nleftarrow, \nLeftarrow</p>

<code>\leftarrowtail</code> AMSsymbols		left arrow tail; non-stretchy see also: \rightarrowtail	↢ class REL
<code>\leftharpoonup</code> <code>\leftarrow</code>		left harpoon arrow; non-stretchy	↽ class REL
<code>\leftarrow</code>		left harpoon arrow; non-stretchy	↼ class REL
<code>\leftleftarrows</code> AMSsymbols		left left arrows; non-stretchy	⇇ class REL
<code>\leftrightarrow</code> <code>\Leftrightarrow</code>		left right arrow; non-stretchy	↔ class REL
<code>\Leftrightarrow</code>		left right arrow; non-stretchy see also: \nleftarrow , \nLeftrightarrow	⇔ class REL
<code>\leftrightarrows</code> AMSsymbols		left right arrows; non-stretchy	⇆ class REL
<code>\leftrightharpoons</code> AMSsymbols		left right harpoons; non-stretchy	⇋ class REL
<code>\leftrightsquigarrow</code> AMSsymbols		left right squiggle arrow; non-stretchy	↭ class REL
<code>\leftroot</code>		used to fine-tune the placement of the index inside <code>\sqrt</code> or <code>\root</code> (see examples) <pre> \sqrt{... \leftroot #1 ...}{...} \root ... \leftroot #1 ... \of {...} </pre> where the argument is a small integer: a positive integer moves the index to the left; a negative integer moves the index to the right Examples: <pre> \sqrt[3]{x} yields $\sqrt[3]{x}$ \sqrt[3\leftroot 1]{x} yields $\sqrt[3]{x}$ \root 3 \of x yields $\sqrt[3]{x}$ \root 3\leftroot{-1} \of x yields $\sqrt[3]{x}$ \root 3\leftroot{-1}\uproot 2 \of x yields $\sqrt[3]{x}$ </pre> see also: \uproot , \root	
<code>\leftthreetimes</code> AMSsymbols			⋋ class BIN
<code>\leqalignno</code>		equation alignment with optionally numbered (tagged) lines; in T_EX , <code>\leqalignno</code> puts the tags on the left, but MathJax doesn't implement this behavior; currently, tags appear in a column on the right separated from the equations by a fixed amount of space (so they don't work like tags in the AMS math environments); this may be fixed in a future version of MathJax <pre> \leqalignno{ <math> & <math> & <equation tag> \cr <repeat as needed> } </pre> the first ampersand is placed where alignment is desired; the second ampersand is used just before a tag; if there is no tag, then the final <code>& <equation tag></code> is omitted; a double-backslash can be used in place of the <code>\cr</code> ; the final <code>\</code> or <code>\cr</code> is optional; output is the same in both inline and display modes (except for the amount of vertical space before and after); Example: <pre> \leqalignno{ 3x - 4y &= 5 &(\dagger) \cr x + 7 &= -2y &(\ddagger)\cr z &= 2 } </pre> yields: $ \begin{array}{rcl} 3x - 4y = 5 & & (\dagger) \\ x + 7 = -2y & & (\ddagger) \\ z = 2 & & \end{array} $ see also: \leqalignno ; the align environment	
<code>\lessapprox</code> AMSsymbols		see also: \lnapprox	⪅ class REL
<code>\lessdot</code> AMSsymbols			⋖ class REL
<code>\lesseqgtr</code> AMSsymbols			⋚ class REL
<code>\lesseqqgtr</code> AMSsymbols			⪋ class REL
<code>\lessgtr</code> AMSsymbols			≶ class REL
<code>\lesssim</code> AMSsymbols		see also: \lnsim	≲ class REL
<code>\lfloor</code>		left floor; non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code> see also: \rfloor , \lceil , \rceil	⌊ class OPEN

<code>\lg</code>	<code>lg</code>	<p>does not change size; default limit placement is the same in both inline and display modes; can change limit placement using \limits; see the Big Operators Table for examples</p>	class OP
<code>\lgroup</code>	<code>(</code>	<p>left group; non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code></p> <p>Example: <code>\left\lgroup</code> <code>\matrix{a & b\cr c & d}</code> yields $\begin{pmatrix} a & b \\ c & d \end{pmatrix}$ <code>\right\rgroup</code></p> <p>see also: \rgroup</p>	$\&\#x27EE$; class OPEN
<code>\lhd</code>	<code><</code>	<p>left-hand diamond</p> <p>see also: \rhd</p>	$\&\#x22B2$; class REL
<code>\lim</code>	<code>lim</code>	<p>limit; does not change size; can change limit placement using <code>\limits</code> and <code>\nolimits</code>; see the Big Operators Table for examples</p> <p>Examples: <code>\lim_{n\rightarrow\infty} f(x) = \ell</code> (inline mode) yields $\lim_{n\rightarrow\infty} f(x) = \ell$ <code>\Lim_{n\rightarrow\infty} f(x) = \ell</code> (display mode) yields $\lim_{n\rightarrow\infty} f(x) = \ell$</p>	class OP
<code>\liminf</code>	<code>lim inf</code>	<p>limit inferior; does not change size; can change limit placement using <code>\limits</code> and <code>\nolimits</code>; see the Big Operators Table for examples</p> <p>Examples: <code>\liminf_{n\rightarrow\infty} x_n = \ell</code> (inline mode) yields $\liminf_{n\rightarrow\infty} x_n = \ell$ <code>\liminf_{n\rightarrow\infty} x_n = \ell</code> (display mode) yields $\liminf_{n\rightarrow\infty} x_n = \ell$</p> <p>see also: \varliminf</p>	class OP
<code>\limits</code>		<p>used to set limits above/below any token of class <code>OP</code>; see the Big Operators table for more information and examples</p> <p>Examples: <code>\int_a^b f(x)\,dx</code> (inline mode) yields $\int_a^b f(x) dx$ <code>\int\limits_a^b f(x)\,dx</code> (inline mode) yields $\int_a^b f(x) dx$ <code>\int_a^b f(x)\,dx</code> (display mode) yields $\int_a^b f(x) dx$ <code>\int\limits_a^b f(x)\,dx</code> (display mode) yields $\int_a^b f(x) dx$ <code>\mathop{x}\limits_{\theta^1}</code> yields $\frac{1}{x}$</p> <p>see also: \nolimits</p>	
<code>\limsup</code>	<code>lim sup</code>	<p>limit superior; does not change size; can change limit placement using <code>\limits</code> and <code>\nolimits</code>; see the Big Operators Table for examples</p> <p>Examples: <code>\limsup_{n\rightarrow\infty} x_n</code> (inline mode) yields $\limsup_{n\rightarrow\infty} x_n$ <code>\limsup_{n\rightarrow\infty} x_n</code> (display mode) yields $\limsup_{n\rightarrow\infty} x_n$</p> <p>see also: \varlimsup</p>	class OP
<code>\ll</code>	<code><<</code>		$\&\#x226A$; class REL
<code>\llap</code>		<p>left overlap</p> <p><code>\llap #1</code></p> <p>creates a box of width zero; the argument is then placed just to the left of this zero-width box (and hence will overlap whatever lies to the left);</p>	class ORD

			<p>proper use of <code>\llap</code> and <code>\rlap</code> in math expressions is somewhat delicate</p> <p>Examples:</p> <p><code>a\mathrel{{=}\llap{/}}b</code> yields $a \neq b$ <code>{=}</code> forces the equal to not have REL spacing (since it is not adjacent to ORD's) and <code>\mathrel{}</code> forces the compound symbol (equal with overlapping slash) to be treated as a single REL</p> <p><code>a\mathrel{{=}\llap{/}\,}b</code> yields $a \neq b$ the thinspace <code>\,</code> improves the spacing</p> <p><code>a=\mathrel{\llap{/}\,}b</code> yields $a \neq b$ this works because the spacing between adjacent REL's is zero</p> <p>see also: \rlap</p>
<code>\llcorner</code>	AMSsymbols		<p>lower left corner Ⓔ_{x2514}; class REL</p> <p><code>\lrcorner</code> AMSsymbols  lower right corner Ⓔ_{x2518}; class REL</p> <p>These are technically delimiters, but MathJax doesn't stretch them like it should.</p> <p>see also: \ulcorner, \urcorner</p>
<code>\Lleftarrow</code>	AMSsymbols		<p>non-stretchy Ⓔ_{x21DA}; class REL</p>
<code>\lll</code>	AMSsymbols		<p>Ⓔ_{x22D8}; class REL</p>
<code>\llless</code>	AMSsymbols		<p>Ⓔ_{x22D8}; class REL</p>
<code>\lmoustache</code>			<p>left moustache; Ⓔ_{x23B0}; class OPEN non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code> (see below)</p> <p>Example:</p> <p><code>\left\lmoustache\phantom{\matrix{a & b\cr c & d}}\right\rmoustache</code> yields $\left(\right)$</p> <p>see also: \rmoustache</p>
<code>\ln</code>		ln	<p>natural logarithm; class OP does not change size; default limit placement is the same in both inline and display modes; can change limit placement using \limits; see the Big Operators Table for examples</p>
<code>\napprox</code>	AMSsymbols		<p>see also: \lessapprox Ⓔ_{x2A89}; class REL</p>
<code>\lneq</code>	AMSsymbols		<p>see also: \leg Ⓔ_{x2A87}; class REL</p>
<code>\lneqq</code>	AMSsymbols		<p>see also: \leqq Ⓔ_{x2268}; class REL</p>
<code>\lnot</code>			<p>logical not Ⓔ_{x00AC}; class ORD</p> <p>see also: \neg</p>
<code>\lnsim</code>	AMSsymbols		<p>see also: \lessim Ⓔ_{x22E6}; class REL</p>
<code>\log</code>		log	<p>logarithm; class OP does not change size; default limit placement is the same in both inline and display modes; can change limit placement using \limits; see the Big Operators Table for examples</p>
<code>\longleftarrow</code>			<p>non-stretchy Ⓔ_{x27F5}; class REL</p>
<code>\Longleftarrow</code>			<p>non-stretchy Ⓔ_{x27F8}; class REL</p>
<code>\longrightarrow</code>			<p>non-stretchy Ⓔ_{x27F6}; class REL</p>
<code>\Longrightarrow</code>			<p>non-stretchy Ⓔ_{x27F9}; class REL</p>
<code>\longleftrightarrow</code>			<p>non-stretchy Ⓔ_{x27F7}; class REL</p>
<code>\Longleftrightarrow</code>			<p>non-stretchy Ⓔ_{x27FA}; class REL</p>
<code>\longmapsto</code>			<p>long maps to Ⓔ_{x27FC}; class REL</p> <p>see also: \mapsto</p>
<code>\looparrowleft</code>	AMSsymbols		<p>non-stretchy Ⓔ_{x21AB}; class REL</p>
<code>\looparrowright</code>	AMSsymbols		<p>non-stretchy Ⓔ_{x21AC}; class REL</p>
<code>\lor</code>		∨	<p>logical OR Ⓔ_{x2228}; class BIN</p> <p>see also: \land, \vee</p>
<code>\lower</code>			<p><code>\lower <dimen> #1</code></p> <p>lowers the argument by the amount specified in <code><dimen></code>; in actual TEX, the argument to <code>\lower</code> (and <code>\raise</code>) must be an <code>\hbox</code>, but in MathJax it can be any expression (using an <code>\hbox</code> is allowed, but not required)</p>

			Example: <code>\lower 2pt {owe} r</code> yields <i>lower</i> see also: \raise	
<code>\lozenge</code>	AMSsymbols	◇		◊ class ORD
<code>\Lsh</code>	AMSsymbols	↵	left shift; non-stretchy see also: \Rsh	↰ class REL
<code>\lt</code>		<	less than see also: \nless	< class REL
<code>\ltimes</code>	AMSsymbols	⋈	see also: \rtimes	⋉ class BIN
<code>\lvert</code> <code>\lVert</code>	AMSmath AMSmath	 	both non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code> Example: <code>\left\lvert\frac{\frac{ab}{\frac{cd}{\right\rvert}}{\right\rvert}</code> yields $\left \frac{a}{\frac{b}{\frac{c}{d}}} \right $ see also: \rvert , \rVert , \lrcorner , \llcorner	∣ class OPEN ∥ class OPEN
<code>\lvertneqq</code>	AMSsymbols	≠		≨ class REL

M

<code>\maltese</code>	AMSsymbols	✠		&#x
<code>\mapsto</code>		↦	maps to; non-stretchy math operator see also: \longmapsto	&#x
<code>\mathbb</code>			blackboard-bold for uppercase letters and lowercase 'k'; if lowercase blackboard-bold letters are not available, then they are typeset in a roman font <code>\mathbb #1</code> Whether lower-case letters are displayed in blackboard-bold, or not, depends on the fonts being used. The MathJax web-based fonts don't have lowercase blackboard-bold, but the STIX fonts do; so users with the STIX fonts installed will be able to display lowercase blackboard-bold letters. Examples: <code>\mathbb R</code> yields \mathbb{R} <code>\mathbb ZR</code> yields \mathbb{ZR} <code>\mathbb{AaBbKk}Cc</code> yields $\mathbb{AaBbKkCc}$ <code>\mathbb{ABCDEFGHJKLMNopqrstuvwxyz}</code> yields $\mathbb{ABCDEFGHJKLMNopqrstuvwxyz}$ see also: \Bbb	
<code>\mathbf</code>			boldface for uppercase and lowercase letters and digits <code>\mathbf #1</code> Examples: <code>\mathbf{AaBb\alpha\beta}123</code> yields $\mathbf{AaBb\alpha\beta}123$ <code>\mathbf ZR</code> yields \mathbf{ZR} <code>\mathbf{uvw}xyz</code> yields $\mathbf{uvw}xyz$ see also: \bf , \boldsymbol	
<code>\mathbin</code>			gives the correct spacing to make an object into a binary operator; binary operators have some extra space around them; creates an element of class BIN <code>\mathbin #1</code> Examples: <code>a\text{op} b</code> yields $aopb$ <code>a\mathbin{\text{op}} b</code> yields $a op b$ <code>a\Diamond b</code> yields $a \diamond b$ <code>a\mathbin{\Diamond} b</code> yields $a \diamond b$	
<code>\mathcal</code>			calligraphic font for uppercase letters and digits <code>\mathcal #1</code> Examples: <code>\mathcal{ABCDEFGHJKLMNopqrstuvwxyz}</code> yields $\mathcal{ABCDEFGHJKLMNopqrstuvwxyz}$ <code>\mathcal{0123456789}</code> yields $\mathcal{0123456789}$ <code>\mathcal{abcdefghijklmnopqrstuvwxyz}</code> yields $\mathcal{abcdefghijklmnopqrstuvwxyz}$ <code>abcdefghijklmnopqrstuvwxyz</code> yields $abcdefghijklmnopqrstuvwxyz$ <code>\mathcal{AB}AB</code> yields $\mathcal{AB}AB$ see also: \cal , \oldstyle	

<code>\mathchoice</code>	<p>provides content that is dependent on the current style (display, text, script, or scriptscript); can be used in defining a macro for general use</p> <p style="text-align: right;"><code>\mathchoice #1 #2 #3 #4</code></p> <p>where:</p> <ul style="list-style-type: none"> • #1 is rendered when the <code>\mathchoice</code> appears in display style • #2 is rendered when the <code>\mathchoice</code> appears in text style • #3 is rendered when the <code>\mathchoice</code> appears in script style • #4 is rendered when the <code>\mathchoice</code> appears in scriptscript style <p>Examples:</p> <p><code>\mathchoice{D}{T}{S}{SS}</code> (in display style) yields D</p> <p><code>\mathchoice{D}{T}{S}{SS}</code> (in text style) yields T</p> <p><code>\mathchoice{D}{T}{S}{SS}</code> (in script style) yields S</p> <p><code>\mathchoice{D}{T}{S}{SS}</code> (in scriptscript style) yields SS</p> <p>Here's a nice example from the T_EXBook: Define:</p> <pre>\def\puzzle{\mathchoice{D}{T}{S}{SS}}</pre> <p>Then:</p> <p><code>\puzzle{\puzzle\over\puzzle^{\puzzle\puzzle}}</code> yields (in display mode) $D \frac{T}{T^S S^S}$</p> <p><code>\puzzle{\puzzle\over\puzzle^{\puzzle\puzzle}}</code> yields (in inline mode) $T \frac{S}{S^S S^S}$</p>
<code>\mathclose</code>	<p>forces the argument to be treated in the 'closing' class; for example, like ')' and ']'; creates an element of class CLOSE</p> <p style="text-align: right;"><code>\mathclose #1</code></p> <p>Examples:</p> <p><code>a + \lt b\gt + c</code> yields $a + < b > + c$</p> <p><code>a + \mathopen\lt b\mathclose\gt + c</code> yields $a + + c$</p> <p>see also: \mathopen</p>
<code>\mathfrak</code>	<p>fraktur font for uppercase and lowercase letters and digits (and a few other characters)</p> <p style="text-align: right;"><code>\mathfrak #1</code></p> <p>Examples:</p> <p><code>\mathfrak{ABCDEFGHIJKLMNOPQRSTUVWXYZ}</code> yields $\mathfrak{ABCDEFGHIJKLMNOPQRSTUVWXYZ}$</p> <p><code>\mathfrak{0123456789}</code> yields $\mathfrak{0123456789}$</p> <p><code>\mathfrak{abcdefghijklmnopqrstuvwxyz}</code> yields $\mathfrak{abcdefghijklmnopqrstuvwxyz}$</p> <p><code>\mathfrak{AB}AB</code> yields $\mathfrak{AB}AB$</p> <p>see also: \frak</p>
<code>\mathinner</code>	<p>some constructions are meant to appear 'inside' other formulas, and should be surrounded by additional space in certain circumstances; this classification is forced on the argument by using <code>\mathinner</code></p> <p style="text-align: right;"><code>\mathinner #1</code></p> <p>Examples:</p> <p><code>ab\text{inside}cd</code> yields $ab\text{inside}cd$</p> <p><code>ab\mathinner{\text{inside}}cd</code> yields $ab\ \textit{inside}\ cd$</p>
<code>\mathit</code>	<p>math italic mode</p> <p style="text-align: right;"><code>\mathit #1</code></p> <p>Examples:</p> <p><code>\rm abc \mathit{def} ghi</code> yields $abc\mathit{def}ghi$</p> <p>in MathJax, this is the same as: \mit and \it</p>
<code>\mathop</code>	<p>forces the argument to be treated in the 'large operator' class; for example, like '\sum'; creates an element of class OP</p> <p style="text-align: right;"><code>\mathop #1</code></p> <p>Examples:</p> <p><code>atbtc</code> yields $atbtc$</p> <p><code>a\mathop{t}b\mathop{t}c</code> yields $a\mathop{t}b\mathop{t}c$</p> <p><code>\star_a^b</code> yields (in display mode) \star_a^b</p> <p><code>\mathop{\star}_a^b</code> yields (in display mode) $\mathop{\star}_a^b$</p>

$\backslash\mathopen$		<p>forces the argument to be treated in the ‘opening’ class; for example, like ‘(’ and ‘[’; creates an element of class OPEN</p> <p style="text-align: right;">$\backslash\mathopen \#1$</p> <p>Examples: $a + \lt b \gt + c$ yields $a + < b > + c$ $a + \mathopen\lt b\mathclose\gt + c$ yields $a + + c$</p> <p>see also: \mathclose</p>
$\backslash\mathord$		<p>forces the argument to be treated in the ‘ordinary’ class; for example, like ‘/’; spacing is determined by pairs of tokens; there is no extra spacing between adjacent ORD's (as in the second example below); there is extra spacing between an ORD and a BIN (as in the first example below); creates an element of class ORD</p> <p style="text-align: right;">$\backslash\mathord \#1$</p> <p>Examples: $a+b+c$ yields $a + b + c$ $a\mathord{+}b\mathord{+}c$ yields $a+b+c$ $1,234,567$ yields $1,234,567$ $1\mathord{,}234\mathord{,}567$ yields $1,234,567$</p>
$\backslash\mathpunct$		<p>forces the argument to be treated in the ‘punctuation’ class; for example, like ‘;’; punctuation tends to have some extra space after the symbol; returns an element of class PUNCT</p> <p style="text-align: right;">$\backslash\mathpunct \#1$</p> <p>Examples: 1.234 yields 1.234 $1\mathpunct{.}234$ yields 1.234</p>
$\backslash\mathrel$		<p>forces the argument to be treated in the ‘relation’ class; for example, like ‘=’ and ‘>’; relations have a bit more space on both sides than binary operators; returns an element of class REL</p> <p style="text-align: right;">$\backslash\mathrel \#1$</p> <p>Examples: $a \# b$ yields $a\#b$ $a \mathrel{\#} b$ yields $a \# b$</p>
$\backslash\mathring$	AMSmath \circ	<p style="text-align: right;">$\backslash\mathring \#1$</p> <p>Examples: $\mathring A$ yields \mathring{A} $\mathring{AB}C$ yields \mathring{ABC}</p>
$\backslash\mathrm$		<p>roman typestyle for uppercase and lowercase letters</p> <p style="text-align: right;">$\backslash\mathrm \#1$</p> <p>Examples: $\mathrm{AaBb\alpha\beta 123}$ yields $AaBb\alpha\beta 123$ ZR yields ZR $\mathrm{uvw}xyz$ yields $uvwxyz$</p> <p>see also: \rm</p>
$\backslash\mathscr$		<p>script typestyle for uppercase letters; if lowercase script letters are not available, then they are typeset in a roman typestyle</p> <p style="text-align: right;">$\backslash\mathscr \#1$</p> <p>Whether lower-case letters are displayed in script, or not, depends on the fonts being used. The MathJax web-based fonts don't have lowercase script, but the STIX fonts do; so users with the STIX fonts installed will be able to display lowercase script letters.</p> <p>Examples: $\mathscr{ABCDEFGHJKLMNOPQRSTUVWXYZ}$ yields $\mathscr{ABCDEFGHIJKLMN O P QRSTUVWXYZ}$ $\mathscr{0123456789}$ yields 0123456789 $\mathscr{abcdefghijklmnopqrstuvwxyz}$ yields $abcdefghijklmnopqrstuvwxyz$ $abcdefghijklmnopqrstuvwxyz$ yields $abcdefghijklmnopqrstuvwxyz$ $\mathscr{AB}AB$ yields \mathscr{ABAB}</p> <p>see also: \scr</p>
$\backslash\mathsf$		<p>sans serif typestyle for uppercase and lowercase letters and digits; also affects uppercase greek (as do the other font switches, like $\backslash\rm$, $\backslash\it$, $\backslash\bf$, $\backslash\mathrm$, $\backslash\mathit$, $\backslash\mathbf$, etc).</p> <p style="text-align: right;">$\backslash\mathsf \#1$</p> <p>Examples: $\mathsf{ABCDEFGHJKLMNOPQRSTUVWXYZ}$ yields $ABCDEFGHJKLMNOPQRSTUVWXYZ$ $\mathsf{0123456789}$ yields 0123456789</p>

		$\backslash\mathsf{abcdefghijklmnopqrstuvwxyz}$ yields $abcdefghijklmnopqrstuvwxyz$ $\backslash\Delta\backslash\Gamma\backslash\Lambda\backslash\mathsf{\Delta\Gamma\Lambda}$ yields $\Delta\Gamma\Lambda\Delta\Gamma\Lambda$ $abcdefghijklmnopqrstuvwxyz$ yields $abcdefghijklmnopqrstuvwxyz$ $\backslash\mathsf{AB}AB$ yields $ABAB$ see also: \sf
$\backslash\mathstrut$		an invisible box whose width is zero; its height and depth are the same as a parenthesis ‘(’; can be used to achieve more uniform appearance in adjacent formulas Examples: $\backslash\sqrt{3} + \backslash\sqrt{\alpha}$ yields $\sqrt{3} + \sqrt{\alpha}$ $\backslash\sqrt{\mathstrut 3} + \backslash\sqrt{\mathstrut\alpha}$ yields $\sqrt{3} + \sqrt{\alpha}$
$\backslash\mathhtt$		typewriter typestyle for uppercase and lowercase letters and digits; also affects uppercase Greek $\backslash\mathhtt \#1$ Examples: $\backslash\mathhtt{ABCDEFGHIJKLMNOPQRSTUVWXYZ}$ yields $ABCDEFGHIJKLMNOPQRSTUVWXYZ$ $\backslash\mathhtt{0123456789}$ yields 0123456789 $\backslash\mathhtt{abcdefghijklmnopqrstuvwxyz}$ yields $abcdefghijklmnopqrstuvwxyz$ $abcdefghijklmnopqrstuvwxyz$ yields $abcdefghijklmnopqrstuvwxyz$ $\backslash\Delta\backslash\Gamma\backslash\Lambda\backslash\mathhtt{\Delta\Gamma\Lambda}$ yields $\Delta\Gamma\Lambda\Delta\Gamma\Lambda$ $\backslash\mathhtt{AB}AB$ yields $ABAB$ see also: \sf
$\backslash\matrix$		matrix (without any delimiters) $\backslash\matrix{ <\math> & <\math> \dots \backslash\cr <repeat as needed> }$ alignment occurs at the ampersands; a double-backslash can be used in place of the $\backslash\cr$; the final $\backslash\backslash$ or $\backslash\cr$ is optional Example: $\backslash\matrix{ a & b \backslash\cr c & d }$ yields $\begin{matrix} a & b \\ c & d \end{matrix}$ see also: \array
$\backslash\max$	max	maximum; does not change size; can change limit placement using $\backslash\limits$ and $\backslash\limits$; see the Big Operators Table for examples Examples: $\backslash\max_{\backslash\rm sub}$ yields (inline mode) \max_{sub} $\backslash\max_{\backslash\rm sub}$ yields (display mode) \max_{sub} see also: \min
$\backslash\mbox$		creates a box just wide enough to hold the text in its argument; no linebreaks are allowed in the text; text appears in $\backslash\rm$ $\backslash\mbox <text argument>$ Examples: $a + b \backslash\mbox{ (are you paying attention?) } = c$ yields $a + b \text{ (are you paying attention?) } = c$ $a + b \backslash\text{ (are you paying attention?) } = c$ yields $a + b \text{ (are you paying attention?) } = c$ in MathJax, these are essentially the same: \text , \hbox see also: \rm
$\backslash\measuredangle$ AMSsymbols	\sphericalangle	$\&\#x$
$\backslash\mho$ AMSsymbols	\mho	$\&\#x$
$\backslash\mid$	$ $	$\&\#x$
		the spacing is perfect for use in set-builder notation Examples: $\backslash\{x \mid x > 1\}$ yields $\{x \mid x > 1\}$ $\backslash\{x \mid x > 1\}$ yields $\{x \mid x > 1\}$ see also: \nmid , \shortmid , \nshortmid
$\backslash\min$	min	minimum; does not change size; can change limit placement using $\backslash\limits$ and $\backslash\limits$; see the Big Operators Table for examples Examples: $\backslash\min_{\backslash\rm sub}$ yields (inline mode) \min_{sub}

		\min_{sub} yields (display mode) \min_{sub} see also: \max	
<code>\mit</code>		math italic typestyle $\mit #1$ Examples: $\mit{\Gamma\Delta\Theta\Omega}$ yields $\Gamma\Delta\Theta\Omega$ $\mathit{\Gamma\Delta\Theta\Omega}$ yields $\Gamma\Delta\Theta\Omega$ $\Gamma\Delta\Theta\Omega$ yields $\Gamma\Delta\Theta\Omega$ in MathJax, this is the same as: \mathit and \it	
<code>\mkern</code>		$\mkern <dimen>$ gives horizontal space Examples: ab yields ab $a\mkern18mu b$ yields $a b$ $a\mkern18pt b$ yields $a b$ in MathJax, these all behave the same: \hskip , \hspace , \kern , \mskip , \mspace	
<code>\mod</code>	mod	modulus operator; modulo; the leading space depends on the style: <code>displaystyle</code> has 18 mu, others 12 mu; 2 thinspaces of following space; for things like equations modulo a number $\mod #1$ Example: $3\equiv 5 \pmod 2$ yields $3 \equiv 5 \pmod 2$ see also: \pmod , \bmod	
<code>\models</code>	\models		$\&\#x$
<code>\moveleft</code> <code>\moveright</code>		shifts boxes to the left or right $\moveleft <dimen> <box>$ $\moveright <dimen> <box>$ In actual TeX , these require an <code>\hbox</code> (or some box) as an argument, and can only appear i MathJax is less picky: you don't need an actual box, and MathJax doesn't have a vertical mo these are not really designed as user-level macros, but instead allow existing macros to wo the box takes up its original space (unlike something like <code>\llap</code> or <code>\rlap</code>), but its contents a (without affecting its bounding box) Examples: $\rm tight$ yields $tight$ $\rm t\moveleft3pt ight$ yields $t\!ight$ $\rm t\moveleft3pt i\moveleft3pt g\moveleft3pt h\moveleft3pt t$ yields $t\!ight$ $\rm t\moveleft3pt i\moveleft6pt g\moveleft9pt h\moveleft12pt t$ yields $t\!ight$ $\square\square\moveleft 2em \{\diamond\diamond\}$ yields $\square\square \diamond\diamond$ $\square\square\moveright 2em \{\diamond\diamond\}$ yields $\square\square \diamond\diamond$ see also: \raise , \lower	
<code>\mp</code>	\mp	minus plus \mp see also: \pm	$\&\#x$
<code>\mskip</code>		$\mskip <dimen>$ gives horizontal space Examples: ab yields ab $a\mskip18mu b$ yields $a b$ $a\mskip18pt b$ yields $a b$ in MathJax, these all behave the same: \hskip , \hspace , \kern , \mkern , \mspace	
<code>\mspace</code>		$\mspace <dimen>$ gives horizontal space Examples: ab yields ab $a\mspace18mu b$ yields $a b$ $a\mspace18pt b$ yields $a b$ in MathJax, these all behave the same: \hskip , \hspace , \kern , \mkern , \mskip	
<code>\mu</code>	μ	lowercase Greek letter mu μ	$\&\#x$
<code>\multimap</code>	AMSSymbols \multimap		$\&\#x$

<code>\nabla</code>			∇ class ORD
<code>\natural</code>		see also: \flat , \sharp	♮ class ORD
<code>\ncong</code> AMSsymbols		not congruent see also: \cong	≆ class REL
<code>\ne</code>		not equal see also: \equals , \neq	≠ class REL
<code>\nearrow</code>		northeast arrow; non-stretchy see also: \nwarrow , \searrow , \swarrow	↗ class REL
<code>\neg</code>		negate; negation see also: \not	¬ class ORD
<code>\negthinspace</code> AMSmath <code>\negmedspace</code> AMSmath <code>\negthickspace</code> AMSmath		negative thin space negative medium space negative thick space Examples: ab yields <i>ab</i> a\negthinspace b yields <i>ab</i> a\negmedspace b yields <i>ab</i> a\negthickspace b yields <i>ab</i> see also: \thinspace	
<code>\neq</code>		see also: \equals , \ne	≠ class REL
<code>\newcommand</code>		for defining your own commands (control sequences, macros, definitions); <code>\newcommand</code> must appear (within math delimiters) before it is used; if desired, you can use the TeX.Macros property of the configuration to define macros in the head <pre>\newcommand\myCommandName [<optional # of arguments, from 1 to 9>] { <replacement text> }</pre> The bracketed # of arguments is omitted when there are no arguments. Example (no arguments): <pre>\newcommand\myHearts {\color{purple}{\heartsuit}\kern-2.5pt\color{green}{\heartsuit}}</pre> <code>\myHearts\myHearts</code> yields:  A definition may take one or more arguments: Example (two arguments): <pre>\newcommand\myHearts[2] {\color{#1}{\heartsuit}\kern-2.5pt\color{#2}{\heartsuit}}</pre> <code>\myHearts{red}{blue}</code> yields:  see also: \def , \newenvironment	
<code>\newenvironment</code>		for defining your own environments ; <code>\newenvironment</code> must appear (within math delimiters) before it is used <pre>\newenvironment{myEnvironmentName} [<optional # of arguments, from 1 to 9>] { <replacement text for each occurrence of \begin{myEnvironmentName}> } { <replacement text for each occurrence of \end{myEnvironmentName}> }</pre> The bracketed # of arguments is omitted when there are no arguments. There must not be a command having the same name as the environment: for example, to use <code>\begin{myHeart}... \end{myHeart}</code> there may not be a command <code>\myHeart</code> . Example (no arguments): <pre>\newenvironment{myHeartEnv} {\color{purple}{\heartsuit}\kern-2.5pt\color{green}{\heartsuit}} {\text{ forever}}</pre> <code>\begin{myHeartEnv}</code> <code>\end{myHeartEnv}</code> yields:  forever An environment may take one or more arguments: Example (two arguments): <pre>\newenvironment{myHeartEnv}[2] {\color{#1}{\heartsuit}\kern-2.5pt\color{#2}{\heartsuit}} {\text{ forever}}</pre> <code>\begin{myHeartEnv}{red}{blue}</code> <code>\end{myHeartEnv}</code> yields:  forever see also: \def , \newcommand	

<code>\newline</code>			line separator in alignment modes and environments in MathJax, these are essentially the same: <code>\cr</code> <code>\l</code>	
<code>\nexists</code>	AMSSymbols	\nexists	see also: \exists	∄ class ORD
<code>\ngeq</code>	AMSSymbols	\ngeq	not greater than or equal to	≱ class REL
<code>\ngeqq</code>	AMSSymbols	\ngeqq	not greater than or equal to see also: \geq , \geqq	≱ class REL
<code>\ngeqslant</code>	AMSSymbols	\ngeqslant	slanted not greater than or equal to see also: \geqslant	⪈ class REL
<code>\ngtr</code>	AMSSymbols	\ngtr	not greater than see also: \gt	≯ class REL
<code>\ni</code>		\ni	backwards 'in'; contains see also: \in	∋ class REL
<code>\leftarrow</code>	AMSSymbols	\leftarrow		↚ class REL
<code>\Leftarrow</code>	AMSSymbols	\Leftarrow	see also: \leftarrow , \Leftrightarrow	⇀ class REL
<code>\leftrightarrow</code>	AMSSymbols	\leftrightarrow		↮ class REL
<code>\Leftrightarrow</code>	AMSSymbols	\Leftrightarrow	see also: \leftrightarrow , \Leftarrow	⇎ class REL
<code>\nleq</code>	AMSSymbols	\nleq	not less than or equal to	≰ class REL
<code>\nleqq</code>	AMSSymbols	\nleqq	not less than or equal to see also: \leq , \leqq	≰ class REL
<code>\nleqslant</code>	AMSSymbols	\nleqslant	slanted not less than or equal to see also: \leqslant	⪇ class REL
<code>\nless</code>	AMSSymbols	\nless	see also: \lt	≮ class REL
<code>\nmid</code>	AMSSymbols	\mid	see also: \mid	∤ class REL
<code>\nobreakspace</code>	AMSmath		Example: <code>a\nobreakspace b</code> yields $a b$ in MathJax, this is the same as: <code>\ (backslash space)</code>	 class ORD
<code>\nolimits</code>			used to change the default placement of limits; only allowed on items of class <code>op</code> Examples: <code>\sum_{k=1}^n a_k</code> yields (in display mode) $\sum_{k=1}^n a_k$ <code>\sum\nolimits_{k=1}^n a_k</code> yields (in display mode) $\sum_{k=1}^n a_k$ see also: \limits	
<code>\normalsize</code>			turns on normal size <code>{\normalsize ... }</code> Example: <code>\rm \scriptsize script \normalsize normal \large large</code> yields \scriptnormallarge see also: \scriptsize	class ORD
<code>\not</code>		$/$	used to negate relations Examples: <code>\not\gt</code> yields \ngtr <code>\ngtr</code> yields \ngtr	/ class REL
<code>\notag</code>	AMSmath		used in AMS math environments that do automatic equation numbering, to suppress the equation number; since MathJax doesn't implement auto-numbering (as of version 1.1a), it is basically a no-op, although it <i>will</i> cancel an explicit <code>\tag</code> ; when auto-numbering is added, then this will work as expected; <code>\notag</code> is included now for compatibility with existing TeX code (to prevent throwing an error, even though it has no effect)	class ORD
<code>\notin</code>		\notin	see also: \in	∉ class REL
<code>\nparallel</code>	AMSSymbols	\nparallel	not parallel see also: \parallel	∦ class REL
<code>\nprec</code>	AMSSymbols	\nprec	see also: \prec	⊀ class REL
<code>\npreceq</code>	AMSSymbols	\npreceq	see also: \preceq	⋠ class REL
<code>\rightarrow</code>	AMSSymbols	\rightarrow		↘ class REL
<code>\Rightarrow</code>	AMSSymbols	\Rightarrow	see also: \rightarrow , \Rightarrow	⇇ class REL

<code>\nsim</code>	AMSSymbols	\approx	see also: \sim	≁ class REL
<code>\nsubseteqq</code>	AMSSymbols	$\not\subseteq$	see also: \subseteq , \subseteqq	⊈ class REL
<code>\nsubseteqqq</code>	AMSSymbols	$\not\subseteqq$		⊈ class REL
<code>\nsucc</code>	AMSSymbols	\succcurlyeq	see also: \succ , \succeq	⊁ class REL
<code>\nsucceq</code>	AMSSymbols	\succneqq		⋡ class REL
<code>\nsupseteq</code>	AMSSymbols	$\not\supseteq$	see also: \supseteq , \supseteqq	⊉ class REL
<code>\nsupseteqq</code>	AMSSymbols	$\not\supseteqq$		⊉ class REL
<code>\ntriangleleft</code>	AMSSymbols	\triangleleft	see also: \triangleleft , \triangleleftteq	⋪ class REL
<code>\ntriangleleftteq</code>	AMSSymbols	\triangleleftteq		⋬ class REL
<code>\ntriangleright</code>	AMSSymbols	\triangleright	see also: \triangleright , \trianglerightteq	⋫ class REL
<code>\ntrianglerightteq</code>	AMSSymbols	\trianglerightteq		⋭ class REL
<code>\nu</code>		ν	lowercase Greek letter nu	ν class ORD
<code>\nVDash</code>	AMSSymbols	\nVdash	see also: \VDash , \vDash , \vdash	⊯ class REL
<code>\nVdash</code>	AMSSymbols	\Vdash		⊮ class REL
<code>\nvDash</code>	AMSSymbols	\nvDash		⊭ class REL
<code>\nvdash</code>	AMSSymbols	\vDash		⊬ class REL
<code>\narrow</code>		\nearrow	northwest arrow; non-stretchy see also: \nearrow , \searrow , \swarrow	↖ class REL

O

<code>\odot</code>		\odot		⊙ class BIN
<code>\ominus</code>		\ominus		⊖ class BIN
<code>\oplus</code>		\oplus		⊕ class BIN
<code>\oslash</code>		\oslash		⊘ class BIN
<code>\otimes</code>		\otimes		⊗ class BIN
<code>\oint</code>		\oint	changes size; can change limit placement using \limits ; see the Big Operators Table for examples	∮ class OP
<code>\oldstyle</code>			this is intended for oldstyle numbers; it is a switch that turns on oldstyle mode; the way it works in T_EX is to select the caligraphic font (which is where the oldstyle numbers are stored), so it has the side effect of selecting caligraphic upper-case letters; MathJax does the same for compatibility $\{\oldstyle \dots\}$ Examples: <code>\oldstyle 0123456789</code> yields <i>0123456789</i> <code>\oldstyle ABCDEFGHIJKLMNOPQRSTUVWXYZ</code> yields <i>ABCDEFGHIJKLMNOPQRSTUVWXYZ</i> <code>\oldstyle abcdefghijklmnopqrstuvwxyz</code> yields <i>abcdefghijklmnopqrstuvwxyz</i> <code>abcdefghijklmnopqrstuvwxyz</code> yields <i>abcdefghijklmnopqrstuvwxyz</i> <code>\oldstyle AB}AB</code> yields <i>ABAB</i> <code>\oldstyle AB \rm AB</code> yields <i>ABAB</i> <code>\oldstyle{AB}CD</code> yields <i>ABCD</i> see also: \cal , \mathcal	class ORD
<code>\omega</code>		ω	lowercase Greek letter omega	ω class ORD
<code>\Omega</code>		Ω	uppercase Greek letter omega see also: \varOmega	Ω class ORD
<code>\omicron</code>		\omicron	lowercase Greek letter omicron	ο class ORD
<code>\operatorname</code>	AMSmath		This is similar to <code>\DeclareMathOperator</code> , but rather than defining a macro, it produces an instance of an operator like <code>\lim</code> . For example, <code>\operatorname{myOp}</code> is equivalent to the use of <code>\myOp</code> , after having defined <code>\DeclareMathOperator{\myOp}{myOp}</code>	class OP

		<p>If displaystyle limits are desired in both inline and display modes, then use <code>operatorname*</code> instead of <code>operatorname</code></p> <p>Examples:</p> <p><code>\operatorname{myFct}(x)</code> yields $\operatorname{myFct}(x)$</p> <p><code>\operatorname*{myFct}_a^b(x)</code> yields (in inline mode) $\operatorname*{myFct}_a^b(x)$</p> <p>See \DeclareMathOperator for further explanation and examples.</p>
<code>\over</code>		<p>general command for making fractions</p> $\{ \langle \text{subformula1} \rangle \over \langle \text{subformula2} \rangle \}$ <p>Creates a fraction: numerator: <code>subformula1</code> denominator: <code>subformula2</code></p> <p>Examples:</p> <p><code>a \over b</code> yields $\frac{a}{b}$</p> <p><code>a+1 \over b+2</code> yields $\frac{a+1}{b+2}$</p> <p><code>{a+1 \over b+2}+c</code> yields $\frac{a+1}{b+2} + c$</p> <p>see also: \above, \abovewithdelims, \atop, \atopwithdelims, \cffrac, \dffrac, \frac, \genfrac, \overwithdelims</p>
<code>\overbrace</code>		<p>puts a (stretchy) over-brace over the argument; can use '^' to place an optional superscript over the overbrace; can use '_' to place an optional subscript below the argument</p> $\overbrace{\hspace{1cm}} \#1$ <p>Example:</p> <p><code>\overbrace{x + \cdots + x}^{\textit{n times}}_{\textit{(note here)}}</code> yields $\overbrace{x + \cdots + x}^{\textit{n times}}_{\textit{(note here)}}$</p> <p>see also: \underbrace</p>
<code>\overleftarrow</code> <code>\overrightarrow</code> <code>\overleftrightharrow</code>	← → ↔	<p><code>&#x2190;</code> stretchy over left arrow <code>&#x2192;</code> stretchy over right arrow <code>&#x2194;</code> stretchy over left right arrow</p> $\overleftarrow{\hspace{1cm}} \#1$ $\overrightarrow{\hspace{1cm}} \#1$ $\overleftrightharrow{\hspace{1cm}} \#1$ <p>Examples:</p> <p><code>\overleftarrow{\textit{the argument}}</code> yields $\overleftarrow{\textit{the argument}}$</p> <p><code>\overrightarrow{AB}</code> yields \overrightarrow{AB}</p> <p><code>\overrightarrow{AB\strut}</code> yields \overrightarrow{AB}</p> <p><code>\overleftrightharrow{\hspace{1cm}}</code> yields $\overleftrightharrow{\hspace{1cm}}$</p>
<code>\overline</code>	-	<p>stretchy overline &#x203E;</p> $\overline{\hspace{1cm}} \#1$ <p>Examples:</p> <p><code>\overline{AB}</code> yields \overline{AB}</p> <p><code>\overline{a}</code> yields \overline{a}</p> <p><code>\overline{\textit{a long argument}}</code> yields $\overline{\textit{a long argument}}$</p>
<code>\overset</code>		$\overset{\hspace{1cm}}{\hspace{1cm}} \#1 \#2$ <p>oversets argument #1 (in scriptstyle) over argument #2</p> <p>Examples:</p> <p><code>\overset{\textit{top}}{\textit{bottom}}</code> yields $\overset{\textit{top}}{\textit{bottom}}$</p> <p><code>\overset{a}{b}</code> yields $\overset{a}{b}$</p> <p><code>a\,\overset{?}{=}\,b</code> yields $a \overset{?}{=} b$</p> <p>see also: \atop, \underset</p>
<code>\overwithdelims</code>		<p>general command for making fractions; uses default thickness for fraction bar for current size</p> $\{ \langle \text{subformula1} \rangle \overwithdelims \langle \text{delim1} \rangle \langle \text{delim2} \rangle \langle \text{subformula2} \rangle \}$ <p>Creates a fraction: numerator <code>subformula1</code></p>

		<p>denominator <code>subformula2</code> <code>delim1</code> is put before the fraction <code>delim2</code> is put after the fraction For an empty delimiter, use ‘.’ in place of the delimiter.</p> <p>Examples:</p> $a \overwithdelims [] b \quad \text{yields} \quad \left[\frac{a}{b} \right]$ $a+1 \overwithdelims . b+2 \quad \text{yields} \quad \frac{a+1}{b+2}$ $\{a+1 \overwithdelims \{ \} b+2\}+c \quad \text{yields} \quad \left\{ \frac{a+1}{b+2} \right\} + c$ <p>see also: \above, \abovewithdelims, \atop, \atopwithdelims, \cfraction, \dfraction, \frac, \genfrac, \over</p>
<code>\owns</code>	⇒	<p>see also: \ni, \in</p> <p style="text-align: right;">&#x220B; class REL</p>

P

<code>\parallel</code>		<p>see also: \nparallel</p> <p style="text-align: right;">&#x2225; class REL</p>
<code>\partial</code>	∂	<p>Example:</p> $\frac{\partial f}{\partial x}$ <p style="text-align: right;">&#x2202; class ORD</p>
<code>\perp</code>	⊥	<p>perpendicular to</p> <p style="text-align: right;">&#x22A5; class REL</p>
<code>\phantom</code>		<p>phantom (both horizontal and vertical) class ORD</p> <p>Sometimes you want to <i>pretend</i> that something is there, for spacing reasons, but you don't want it to appear—you want it to be invisible—you want it to be a phantom.</p> <p>The box created by <code>\phantom</code> has width, height and depth equal to its argument. In other words, <code>\phantom</code> creates horizontal and vertical space equal to that of its argument, even though the argument isn't visible.</p> <p style="text-align: right;"><code>\phantom #1</code></p> <p>Examples:</p> $\sqrt{\frac{a}{b}} \sqrt{\phantom{\frac{a}{b}}} \quad \text{yields} \quad \sqrt{\frac{a}{b}} \sqrt{\phantom{\frac{a}{b}}}$ $\frac{2x+3y-z}{x+y+5z} \quad \text{yields} \quad \frac{2x+3y-z}{x+y+5z}$ $\Gamma^{j}_{i} \quad \text{yields} \quad \Gamma_{i\ k}^j$ $\begin{matrix} 1 & -1 \\ 2 & 3 \end{matrix} \quad \text{yields} \quad \begin{matrix} 1 & -1 \\ 2 & 3 \end{matrix}$ <p>see also: \hphantom, \vphantom</p>
<code>\phi</code>	φ	<p>lowercase Greek letter phi</p> <p style="text-align: right;">&#x03D5; class ORD</p>
<code>\Phi</code>	Φ	<p>uppercase Greek letter phi</p> <p style="text-align: right;">&#x03A6; class ORD</p> <p>see also: \varphi, \varPhi</p>
<code>\pi</code>	π	<p>lowercase Greek letter pi</p> <p style="text-align: right;">&#x03C0; class ORD</p>
<code>\Pi</code>	Π	<p>uppercase Greek letter Pi</p> <p style="text-align: right;">&#x03A0; class ORD</p> <p>see also: \varpi, \varPi</p>
<code>\pitchfork</code> <small>AMSsymbols</small>	⋈	<p style="text-align: right;">&#x22D4; class REL</p>
<code>\pm</code>	±	<p>plus or minus</p> <p>see also: \mp</p> <p style="text-align: right;">&x00B1; class BIN</p>
<code>\pmatrix</code>		<p>matrix enclosed in parentheses class OPEN</p> $\pmatrix{ <math> & <math> \dots \cr <repeat as needed> }$ <p>alignment occurs at the ampersands; a double-backslash can be used in place of the <code>\cr</code>; the final <code>\\</code> or <code>\cr</code> is optional</p> <p>Example:</p> $A = \pmatrix{ a_{11} & a_{12} & \dots & a_{1n} \cr a_{21} & a_{22} & \dots & a_{2n} \cr \vdots & \vdots & \ddots & \vdots \cr a_{m1} & a_{m2} & \dots & a_{mn} }$ <p>see also: \matrix</p>
<code>\pmb</code>		<p>poor man's bold; it works by duplicating its argument slightly offset, giving a bold effect (at least in the horizontal direction); doesn't work well for horizontal lines, like <code>-</code> or <code>+</code></p> <p style="text-align: right;">class ORD</p> <p style="text-align: right;"><code>\pmb #1</code></p> <p>Examples:</p>

		a <code>\pmb a</code> <code>\boldsymbol a</code> yields <i>aaa</i> $a+b-c$ <code>\ \ a+b-c</code> yields <i>a + b - c</i> <i>a + b - c</i>
<code>\pmod</code>	(mod)	parenthesized modulus operator; parenthesized modulo; 18 mu of leading space before the opening parenthesis in display style; 8 mu of leading space before the opening parenthesis in other styles; 6 mu of space after the word <code>mod</code> $\pmod{\#1}$ Examples: $5 \equiv 8 \pmod{3}$ yields $5 \equiv 8 \pmod{3}$ $\pmod{n+m}$ yields $\pmod{n+m}$ see also: \mod , \bmod
<code>\pod</code>	()	parenthesized argument with leading space; 18 mu of leading space before the opening parenthesis in display style; 8 mu of leading space before the opening parenthesis in other styles $\pod{\#1}$ Examples: $x=y$ <code>\pod{\text{inline mode}}</code> yields $x = y$ (inline mode) $x=y$ <code>\pod{\text{display mode}}</code> yields $x = y$ (display mode)
<code>\Pr</code>	Pr	does not change size; class OP default limit placement can be changed using <code>\limits</code> and <code>\nolimits</code> ; does not change size; see the Big Operators Table for more examples Examples: \Pr_{sub} yields (inline mode) \Pr_{sub} \Pr_{sub} yields (display mode) \Pr_{sub}
<code>\prec</code>	\prec	see also: \nprec class REL
<code>\precapprox</code>	\precapprox	class REL
<code>\precnapprox</code>	\precnapprox	class REL
<code>\preccurlyeq</code>	\preccurlyeq	class REL
<code>\preceq</code>	\preceq	class REL
<code>\precneqq</code>	\precneqq	class REL
		see also: \npreceq
<code>\precsim</code>	\precsim	class REL
<code>\precnsim</code>	\precnsim	class REL
<code>\prime</code>	'	prime character class ORD Examples: f' yields f' $f\prime$ yields f' f^\prime yields f' $f^{\prime\prime}$ yields f'' f'' yields f'' see also: \backprime , prime symbol
<code>\prod</code>	\prod	changes size; class OP can change limit placement using \limits and \nolimits ; see the Big Operators Table for more examples Examples: $\prod_{j=1}^n$ yields (in inline mode) $\prod_{j=1}^n$ $\prod_{j=1}^n$ yields (in display mode) $\prod_{j=1}^n$
<code>\projlim</code>	proj lim	projective limit; class OP does not change size; can change limit placement using \limits and \nolimits ; see the Big Operators Table for examples see also: \varprojlim
<code>\propto</code>	\propto	see also: \varpropto class REL
<code>\psi</code>	ψ	lowercase Greek letter psi class ORD
<code>\Psi</code>	Ψ	uppercase Greek letter psi class ORD
		see also: \varPsi

Q

\backslashquad \backslashqqquad		\backslashquad is a 1em space \backslashqqquad is a 2em space Examples: $ \backslashquad \backslashquad $ yields $ $ $ \backslashqqquad\hphantom{ } $ yields $ $
--	--	--

R

\backslashraise		$\backslashraise <dimen> \#1$ raises the argument by the amount specified in $<dimen>$; in actual T_EX , the argument to \backslashraise (and \backslashlower) must be an \backslashhbox , but in MathJax it can be any expression (using an \backslashhbox is allowed, but not required) Example: $\backslashhraise 2pt \{ighe\} r$ yields <i>higher</i> see also: \lower
\backslashrangle	}	right angle bracket; non-stretchy when used alone; stretchy when used with \backslashleft or \backslashright (see below) Ⓔx27E9; class CLOSE Example: $\backslashleft\langle \backslashmatrix{a & b\cr c & d} \backslashright\rangle$ yields $\left\langle \begin{matrix} a & b \\ c & d \end{matrix} \right\rangle$ see also: \langle
\backslashrbrace	}	right brace; non-stretchy when used alone; stretchy when used with \backslashleft or \backslashright (see below) class CLOSE Example: $\backslashleft\brace \backslashmatrix{a & b\cr c & d} \backslashright\brace$ yields $\left\{ \begin{matrix} a & b \\ c & d \end{matrix} \right\}$ see also: \lbrace
\backslashrbrack]	right bracket; non-stretchy when used alone; stretchy when used with \backslashleft or \backslashright (see below) class CLOSE Examples: $\backslashlbrack \backslashfrac ab, c \backslashrbrack$ yields $\left[\frac{a}{b}, c \right]$ $\backslashleft\lbrack \backslashfrac ab, c \backslashright\rbrack$ yields $\left[\frac{a}{b}, c \right]$ see also: \lbrack , \lbracket
\backslashrceil	⌋	right ceiling; non-stretchy when used alone; stretchy when used with \backslashleft or \backslashright (see below) Ⓔx2309; class CLOSE Example: $\backslashleft\lceil \backslashmatrix{a & b\cr c & d} \backslashright\rceil$ yields $\left\lceil \begin{matrix} a & b \\ c & d \end{matrix} \right\rceil$ see also: \lceil , \lfloor , \rfloor
\backslashRe	ℜ	Ⓔx211C; class ORD
\backslashrenewcommand		equivalent to \newcommand ; for clarity of code, you may choose to use \backslashrenewcommand when re-defining a macro; this is different from actual T_EX , where \backslashrenewcommand only allows redefining of an existing command see also: \def , \newcommand , \newenvironment
\backslashrequire (non-standard)		This is a MathJax-specific macro that can be used to load MathJax T_EX extensions (like the AMSmath extension) from within math mode, rather than having to include it in the configuration. For example, $\backslashrequire\{AMSSymbols\}$ would cause MathJax to load the <code>extensions/TeX/AMSSymbols.js</code> file at that point. Since many people use MathJax in blogs and wikis that may not have all the extensions loaded, this makes it possible to load a lesser-used extension on a particular page, without having to include it in <i>every</i> page.
\backslashrestriction	↑	Ⓔx21BE; class REL

<code>\rfloor</code>	⌋	right floor; non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code> see also: \lfloor \lceil \rceil	⌋ class CLOSE
<code>\rgroup</code>)	right group; non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code> Example: <code>\left\lgroup</code> <code>\matrix{a & b\cr c & d}</code> yields $\begin{pmatrix} a & b \\ c & d \end{pmatrix}$ <code>\right\rgroup</code> see also: \lgroup	⟮ class CLOSE
<code>\rhd</code> AMSsymbols	▷	right-hand diamond see also: \lhd	⊳ class REL
<code>\rho</code>	ρ	lowercase Greek letter rho see also: \varrho	� class ORD
<code>\right</code>		used for stretchy delimiters; see the Variable-Sized Delimiters Table for details Can be followed by: delimiter: sample code: yields: () <code>\left(\frac{1}{2} \right)</code> $\left(\frac{1}{2}\right)$ <code>\updownarrow</code> <code>\left\updownarrow \phantom{\frac{1}{2}} \right\updownarrow</code> \updownarrow <code>\Downarrow</code> <code>\left\Downarrow \phantom{\frac{1}{2}} \right\Downarrow</code> \Downarrow see also: \left	
<code>\rightarrow</code>	→	non-stretchy	→ class REL
<code>\Rightarrow</code>	⇒	non-stretchy	⇒ class REL
		see also: \nrightarrow , \nRrightarrow , \to	
<code>\rightarrowtail</code> AMSsymbols	↘	right arrow tail; non-stretchy see also: \leftarrowtail	↣ class REL
<code>\rightharpoonup</code>	↷	non-stretchy	⇁ class REL
<code>\rightharpoonup</code>	↷	non-stretchy	⇀ class REL
		see also: \leftharpoonup , \rightharpoonup	
<code>\rightleftarrows</code> AMSsymbols	↔	right left arrows; non-stretchy	⇄ class REL
<code>\rightleftharpoons</code> AMSsymbols	↔	right left harpoons; non-stretchy	⇌ class REL
<code>\rightrightarrows</code> AMSsymbols	⇒	right right arrows; non-stretchy	⇉ class REL
<code>\rightsquigarrow</code> AMSsymbols	↗	right squiggle arrow; non-stretchy	⇝ class REL
<code>\rightthreetimes</code> AMSsymbols	⋈	right three times	⋌ class BIN
<code>\risingdotseq</code> AMSsymbols	⋈	rising dot sequence see also: \fallingdotseq	≓ class REL
<code>\rlap</code>		right overlap <code>\rlap #1</code> creates a box of width zero; the argument is then placed just to the right of this zero-width box (and hence will overlap whatever lies to the right) Example: <code>a\mathrel{\rlap{/}{=}}b</code> yields $a \neq b$ In this example, <code>{=}</code> forces the equal to not have REL spacing (since it is not adjacent to ORD's); <code>\mathrel{}</code> forces the compound symbol (equal with overlapping slash) to be treated as a single REL; the <code>\;</code> improves the spacing for the slash. see also: \llap	class ORD
<code>\rm</code>		turns on roman; affects uppercase and lowercase letters, and digits; also affects uppercase Greek <code>\rm ...</code> Examples: <code>\rm AaBb\alpha\beta a123</code> yields AaBbαβ123 <code>{\rm A B} A B</code> yields ABAB <code>\Delta\Gamma\Lambda{\rm\Delta\Gamma\Lambda}</code> yields ΔΓΛΔΓΛ <code>\rm AB \bf CD</code> yields ABCD <code>\rm{AB}CD</code> yields ABCD	class ORD

			see also: \text , \hbox , \mathrm
<code>\rmoustache</code>)	right moustache; non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code> (see below) Example: <pre>\left\rmoustache \phantom{\matrix{a & b\cr c & d}} yields \right\rmoustache</pre> yields $\left. \phantom{\matrix{a & b\cr c & d}} \right)$ see also: \lmoustache
<code>\root ... \of</code>			$\root <index> \of \#1$ Examples: <code>\root 3 \of x</code> yields $\sqrt[3]{x}$ <code>\root 13 \of {\frac 12}</code> yields $\sqrt[13]{\frac{1}{2}}$ <code>\root n+1 \of x + 2</code> yields $\sqrt[n+1]{x + 2}$ see also: \sqrt , \leftroot , \uproot
<code>\Rrightarrow</code>	AMSsymbols	\Rightarrow	non-stretchy Ⓔx21DB; class REL
<code>\Rsh</code>	AMSsymbols	\rightarrow	right shift; non-stretchy Ⓔx21B1; class REL see also: \Lsh
<code>\rtimes</code>	AMSsymbols	\rtimes	see also: \ltimes Ⓔx22CA; class BIN
<code>\Rule</code> (non-standard)			a MathJax-specific macro giving a rule with a specified width, height, and depth $\Rule <dimenWidth> <dimenHeight> <dimenDepth>$ where each argument is a dimension Examples: <code>x\Rule{3px}{1ex}{2ex}x</code> yields $x \rule{3px}{1ex}{2ex} x$ <code>x\Rule{3px}{2ex}{1ex}x</code> yields $x \rule{3px}{2ex}{1ex} x$
<code>\rvert</code> <code>\rVert</code>	AMSMath AMSMath	 	Ⓔx2223; class CLOSE Ⓔx2225; class CLOSE both non-stretchy when used alone; stretchy when used with <code>\left</code> or <code>\right</code> Example: <pre>\left\rvert\frac{a}{b}\right\rvert yields \left\rVert\frac{a}{b}\right\rVert</pre> see also: \vert , \Vert , \lvert , \lVert

S

<code>\S</code>	§	section symbol ⒺxXA
<code>\scr</code>		turns on script typestyle for uppercase letters; lowercase letters are in a roman typestyle $\{ \scr \dots \}$ Examples: <code>\scr ABCDEFGHIJKLMNOPQRSTUVWXYZ</code> yields <i>ABCDEFGHIJKLMN OPQRST UVWXYZ</i> <code>\scr 0123456789abcdefghijklmnopqrstuvwxy</code> yields <i>0123456789abcdefghijklmnopqrstuvwxy</i> <code>0123456789abcdefghijklmnopqrstuvwxy</code> yields <i>0123456789abcdefghijklmnopqrstuvwxy</i> <code>{\scr AB}AB</code> yields <i>ABAB</i> <code>\scr AB \rm AB</code> yields <i>ABAB</i> <code>\scr{AB}CD</code> yields <i>ABC D</i> see also: \mathscr
<code>\scriptscriptstyle</code>		used to over-ride automatic style rules and force scriptscript style; stays in force until the end of math mode or the braced group, or until another style is selected $\{ \scriptscriptstyle \dots \}$ Example: In inline mode: <pre>\frac ab+\displaystyle\frac ab+\textstyle\frac ab+\scriptstyle\frac ab+\scriptscriptstyle\frac ab</pre> yields: $\frac{a}{b} + \frac{a}{b} + \frac{a}{b} + \frac{a}{b} + \frac{a}{b}$ Example: In inline mode: <pre>\frac ab + {\scriptscriptstyle \frac cd + \frac ef} + \frac gh</pre> yields $\frac{a}{b} + \frac{c}{d} + \frac{e}{f} + \frac{g}{h}$

		<p>Example: In inline mode: <code>\frac ab + \scriptscriptstyle{\frac cd + \frac ef} + \frac gh</code> yields $\frac{a}{b} + \frac{c}{d} + \frac{e}{f} + \frac{g}{h}$</p> <p>see also: \displaystyle, \scriptstyle, \textstyle</p>
<code>\scriptsize</code>		<p>turns on script size</p> $\{ \scriptsize \dots \}$ <p>Example: <code>\rm \scriptsize script \normalsize normal \large large</code> yields <code>scriptnormallarge</code></p> <p>see also: \normalsize</p>
<code>\scriptstyle</code>		<p>used to over-ride automatic style rules and force script style; stays in force until the end of math mode or the braced group, or until another style is selected</p> $\{ \scriptstyle \dots \}$ <p>Example: In inline mode: <code>\frac ab+\displaystyle\frac ab+\textstyle\frac ab+\scriptstyle\frac ab+\scriptscriptstyle\frac ab</code> yields: $\frac{a}{b} + \frac{a}{b} + \frac{a}{b} + \frac{a}{b} + \frac{a}{b}$</p> <p>Example: In inline mode: <code>\frac ab + {\scriptstyle \frac cd + \frac ef} + \frac gh</code> yields $\frac{a}{b} + \frac{c}{d} + \frac{e}{f} + \frac{g}{h}$</p> <p>Example: In inline mode: <code>\frac ab + \scriptstyle{\frac cd + \frac ef} + \frac gh</code> yields $\frac{a}{b} + \frac{c}{d} + \frac{e}{f} + \frac{g}{h}$</p> <p>see also: \displaystyle, \scriptscriptstyle, \textstyle</p>
<code>\searrow</code>		<p>southeast arrow; non-stretchy &#x2</p> <p>see also: \nearrow, \nwarrow, \swarrow</p>
<code>\sec</code>	<code>sec</code>	<p>secant; does not change size; default limit placement is the same in both inline and display modes; can change limit placement using \limits; see the Big Operators Table for more examples</p> <p>Examples: <code>\sec x</code> yields <code>sec x</code> <code>\sec(2x-1)</code> yields <code>sec(2x - 1)</code></p> <p>see also: \csc</p>
<code>\setminus</code>	<code>\</code>	<p>set minus &#x2</p> <p>Examples: <code>A\setminus B</code> yields <code>A \ B</code> <code>A\backslash B</code> yields <code>A \ B</code></p> <p>see also: \backslash</p>
<code>\sf</code>		<p>turns on sans serif mode for uppercase and lowercase letters and digits, and for uppercase Greek</p> $\{ \sf \dots \}$ <p>Examples: <code>\sf ABCDEFGHIJKLMNOPQRSTUVWXYZ</code> yields <code>ABCDEFGHIJKLMNOPQRSTUVWXYZ</code> <code>\sf 0123456789</code> yields <code>0123456789</code> <code>\sf abcdefghijklmnopqrstuvwxyz</code> yields <code>abcdefghijklmnopqrstuvwxyz</code> <code>ABCDE 01234 abcde</code> yields <code>ABCDE01234abcde</code> <code>{\sf AB\Delta\Gamma\Lambda}\ AB\Delta\Gamma\Lambda</code> yields <code>ABΔΓΛ ABΔΓΛ</code> <code>\sf AB \rm AB</code> yields <code>ABAB</code> <code>\sf{AB}CD</code> yields <code>ABCD</code></p> <p>see also: \mathsf</p>
<code>\sharp</code>	<code>#</code>	<p>musical sharp symbol &#x2</p> <p>see also: \flat, \natural</p>
<code>\shortmid</code>	AMSsymbols <code> </code>	<p>see also: \nshortmid, \mid &#x2</p>
<code>\shortparallel</code>	AMSsymbols <code> </code>	<p>see also: \nshortparallel &#x2</p>
<code>\shoveleft</code> <code>\shoveright</code>	AMSMath AMSMath	<p>forces flush left or flush right typesetting in a \multiline or \multiline* environment (see \begin{multiline})</p> <p>Example: <code>\begin{multiline}</code></p>

		<pre>(a+b+c+d)^2 \\ + (e+f)^2 + (g+h)^2 + (i+j)^2 + (k+l)^2 \\ + (m+n)^2 + (o+p)^2 + (q+r)^2 + (s+t)^2 + (u+v)^2 \\ + (w+x+y+z)^2 \end{multline}</pre> <p>yields</p> $(a + b + c + d)^2 + (e + f)^2 + (g + h)^2 + (i + j)^2 + (k + l)^2 + (m + n)^2 + (o + p)^2 + (q + r)^2 + (s + t)^2 + (u + v)^2 + (w + x + y + z)^2$ <p>Example:</p> <pre>\begin{multline} (a+b+c+d)^2 \\ \shoveleft{+ (e+f)^2 + (g+h)^2 + (i+j)^2 + (k+l)^2} \\ \shoveright{+ (m+n)^2 + (o+p)^2 + (q+r)^2 + (s+t)^2 + (u+v)^2} \\ + (w+x+y+z)^2 \end{multline}</pre> <p>yields</p> $(a + b + c + d)^2 + (e + f)^2 + (g + h)^2 + (i + j)^2 + (k + l)^2 + (m + n)^2 + (o + p)^2 + (q + r)^2 + (s + t)^2 + (u + v)^2 + (w + x + y + z)^2$
<code>\sideset</code>	AMSMath	<p>used for putting symbols at the four ‘corners’ of a large operator (like \sum or \prod)</p> $\sideset{_{#1^{#2}}}{_{#3^{#4}}} <large operator>$ <p>where:</p> <ul style="list-style-type: none"> • #1 = lower left • #2 = upper left • #3 = lower right • #4 = upper right <p>Examples:</p> <pre>\sideset{_1^2}{_3^4}\sum yields ${}_1^2\sum_3^4$</pre>
<code>\sigma</code> <code>\Sigma</code>	σ Σ	<p>lowercase Greek letter sigma &#x0</p> <p>uppercase Greek letter sigma &#x0</p> <p>see also: \sum, \varsigma, \varSigma</p>
<code>\sim</code> <code>\simeq</code>	\sim \simeq	<p>&#x2 &#x2</p> <p>see also: \nsim</p>
<code>\sin</code>	sin	<p>sine; does not change size; default limit placement is the same in both inline and display modes; can change limit placement using \limits; see the Big Operators Table for more examples</p> <p>Examples: <code>\sin x</code> yields $\sin x$ <code>\sin(2x-1)</code> yields $\sin(2x - 1)$</p> <p>see also: \cos</p>
<code>\sinh</code>	sinh	<p>hyperbolic sine; does not change size; default limit placement is the same in both inline and display modes; can change limit placement using \limits; see the Big Operators Table for more examples</p> <p>Examples: <code>\sinh x</code> yields $\sinh x$ <code>\sinh(2x-1)</code> yields $\sinh(2x - 1)$</p> <p>see also: \cosh</p>
<code>\skew</code>		<p>used to finely adjust the positioning on accents; particularly useful for adjusting superaccents (accents on accents); usually requires trial-and-error adjustment for proper positioning</p> $\skew #1 <accent>$ <p>where #1 is a positive integer (the skew amount)</p> <p>Examples: <code>\hat A</code> yields \hat{A}</p>

		<pre>\skew7\hat A</pre> yields \hat{A} <pre>\tilde M</pre> yields \tilde{M} <pre>\skew{8}\tilde M</pre> yields \tilde{M} <pre>\hat{\hat A}</pre> yields $\hat{\hat{A}}$ <pre>\skew4\hat{\hat A}</pre> yields $\hat{\hat{A}}$
<code>\small</code>		<p>turns on small size; affects all math</p> <p style="text-align: right;"><code>{\small ... }</code></p> <p>Example:</p> <pre>\rm\tiny tiny \Tiny Tiny \small small \normalsize normal \large lg \Large Lg \LARGE LG \huge hg \Huge Hg</pre> yields <small>tiny</small> TinySmallnormallgLgLGhgHg
		<pre>\def\myExp{\alpha\frac xy} \tiny\myExp \Tiny\myExp \small\myExp \normalsize\myExp \large\myExp \Large\myExp \LARGE\myExp \huge\myExp \Huge\myExp</pre> yields $\alpha \frac{x}{y} \alpha \frac{x}{y} \alpha \frac{x}{y} \alpha \frac{x}{y} \alpha \frac{x}{y} \alpha \frac{x}{y} \alpha \frac{x}{y} \alpha \frac{x}{y} \alpha \frac{x}{y}$
		<pre>ab{\small cd} cd</pre> yields <i>abcdcd</i> <pre>ab\small{cd} cd</pre> yields <i>abcdcd</i>
		see also: \tiny , \Tiny , \normalsize , \large , \Large , \LARGE , \huge , \Huge
<code>\smallfrown</code>	AMSSymbols	\frown small frown $\delta \# \times 2$ see also: \frown , \smile , \smallsmile
<code>\smallint</code>		\int small integral $\delta \#$ see also: \int
<code>\smallsetminus</code>	AMSSymbols	\setminus small set minus $\delta \# \times 2$ see also: \setminus
<code>\smallsmile</code>	AMSSymbols	\smile small smile $\delta \# \times 2$ see also: \smile , \frown , \smallfrown

\smash		<p>By using <code>\smash</code>, \phantom, \hphantom, \vphantom, \rlap, \llap, you can typeset any mathematics, yet give it the width and/or height and/or depth of any other mathematics.</p> <p style="text-align: center;"><code>\smash #1</code></p> <p>Typesets the argument in a box with the same width as the argument, but with height and depth equal to zero. In other words: the argument of <code>\smash</code> is visible, and has its natural width, but does not contribute any height or depth to the surrounding mathematics (hence leaving the surrounding mathematics to dictate height and depth). Here are some scenarios:</p> <ul style="list-style-type: none"> to vertically <code>\smash</code> the box containing <code>this</code> and make it instead behave vertically like <code>\smash{this}\vphantom{that}</code> <p>Examples:</p> $\sqrt{\frac{a}{b}} \quad \sqrt{\smash{7}\vphantom{\frac{a}{b}}} \quad \text{yields} \quad \sqrt{\frac{a}{b}} \sqrt{7}$ $\sqrt{\frac{\frac{a}{b}}{\frac{c}{d}}} \quad \sqrt{\smash{\frac{a}{b}}\vphantom{\frac{c}{d}}} \quad \text{yields} \quad \sqrt{\frac{a}{b}} \sqrt{\frac{e}{f}}$ <ul style="list-style-type: none"> to horizontally compress the box containing <code>this</code> and make it instead behave horizontally like <code>\rlap{this}\hphantom{that}</code> or <code>\hphantom{that}\llap{this}</code> <p>Examples:</p> $\sqrt{\rm\ very\ wide} \quad \sqrt{\rlap{\rm\ thin}\hphantom{\rm\ very\ wide}} \quad \text{yields} \quad \sqrt{\text{very wide}} \sqrt{\text{thin}}$ $\sqrt{\rm\ very\ wide} \quad \sqrt{\hphantom{\rm\ very\ wide}\llap{\rm\ thin}} \quad \text{yields} \quad \sqrt{\text{very wide}} \sqrt{\text{thin}}$ <ul style="list-style-type: none"> to both vertically smash and horizontally compress the box containing <code>this</code> and make it instead behave both vertically and horizontally like <code>\rlap{\smash{this}}</code> or <code>\llap{\smash{this}}</code> <p>Examples:</p> $\sqrt{\matrix{a & b \cr c & d}} \quad \sqrt{\rlap{\smash{\rm\ Hi!}}\phantom{\matrix{a & b \cr c & d}}} \quad \text{yields} \quad \sqrt{a \ b} \sqrt{c \ d} \sqrt{\text{Hi!}}$ <p>see also: \hphantom, \vphantom, \phantom, \llap, \rlap</p>
\smile	☺	<p>smile &#x2</p> <p>see also: \smallsmile, \frown, \smallfrown</p>
\space		<p>Example: &#</p> <p><code>a\space b</code> yields $a \ b$</p> <p>in MathJax, this is the same as: \ (backslash space), \nobreakspace</p>
\Space (non-standard)		<p>a MathJax-specific macro giving space with a specified width, height, and depth</p> <p style="text-align: center;"><code>\Space <dimenWidth> <dimenHeight> <dimenDepth></code></p> <p>where each argument is a dimension</p> <p>Compare:</p> $a\Rule{5px}{4ex}{2ex}^b_c d \quad \text{yields} \quad a \begin{matrix} b \\ c \\ d \end{matrix}$ $a\Space{5px}{4ex}{2ex}^b_c d \quad \text{yields} \quad a \begin{matrix} b \\ c \\ d \end{matrix}$ <p>see also: \Rule</p>
\spadesuit	♠	<p>see also: \clubsuit, \diamondsuit, \heartsuit &#x2</p>
\sphericalangle AMSsymbols	◁	<p>&#x2</p>
\sqcap	◻	<p>square cap &#x2</p>
\sqcup	◻	<p>square cup &#x2</p>
\sqrt	✓	<p>square root (and other roots)</p> <p style="text-align: center;"><code>\sqrt #1</code></p> <p style="text-align: center;"><code>\sqrt[n]{op}</code> is equivalent to <code>\root n \of {op}</code></p> <p>Examples:</p> $\sqrt{x} \quad \text{yields} \quad \sqrt{x}$ $\sqrt{xy} \quad \text{yields} \quad \sqrt{xy}$ $\sqrt{\{xy\}} \quad \text{yields} \quad \sqrt{\{xy\}}$

		$\sqrt[3]{x+1}$ yields $\sqrt[3]{x+1}$ see also: \root	
<code>\sqsubset</code>	AMSsymbols	\sqsubset	square subset
<code>\sqsupset</code>	AMSsymbols	\sqsupset	square superset
<code>\sqsubseteq</code>		\sqsubseteq	
<code>\sqsupseteq</code>		\sqsupseteq	
<code>\square</code>	AMSsymbols	\square	
<code>\stackrel</code>			stack relations; you can stack anything (not just relations) but it creates an item of class REL (and usually the bottom is a REL to start with, but doesn't have to be) $\stackrel{\#1}{\#2}$ where #1 (in superscript style) is stacked on top of #2 Examples: $\stackrel{\text{def}}{=}$ yields $\stackrel{\text{def}}{=}$ $\stackrel{\text{top}}{\text{bottom}}$ yields $\stackrel{\text{top}}{\text{bottom}}$
<code>\star</code>		★	
<code>\strut</code>			an invisible box with no width, height 8.6pt and depth 3pt; note that <code>\mathstrut</code> changes with the current size, but <code>\strut</code> does not Examples: $\sqrt{}\sqrt{\mathstrut}\sqrt{\strut}$ $\sqrt{}\sqrt{\mathstrut}\sqrt{\strut}$ $\sqrt{}\sqrt{\mathstrut}\sqrt{\strut}$ $\sqrt{}\sqrt{\mathstrut}\sqrt{\strut}$ see also: \mathstrut
<code>\style</code>			[HTML] non-standard; used to apply CSS styling to mathematics $\style \#1 \#2$ where: <ul style="list-style-type: none"> #1 is a (single) CSS style declaration #2 is the mathematics to be styled Examples: $\frac{\text{color:red}{x+1}}{y+2}$ yields $\frac{x+1}{y+2}$ $\text{background-color:yellow}\frac{x+1}{y+2}$ yields $\frac{x+1}{y+2}$ Example: Consider the following HTML/Javascript/MathJax code: <pre><button type="button" onclick="makeVisible()">Click to reveal answer</button> <script type="text/javascript"> function makeVisible() { document.getElementById('answer').style.visibility = "visible"; } </script> \$\$ (x+1)^2 = \cssId{answer}\style{visibility:hidden}{(x+1)(x+1)} \$\$</pre> Then, the result of this HTML/Javascript/MathJax code is: <div style="border: 1px solid gray; padding: 2px; display: inline-block; margin: 5px;">Click to reveal answer</div> $(x+1)^2 = (x+1)(x+1)$ see also: \class , \cssId
<code>\subset</code>		\subset	
<code>\Subset</code>	AMSsymbols	\Subset	
<code>\subseteq</code>		\subseteq	
<code>\subsetneq</code>	AMSsymbols	\subsetneq	

<code>\subseteqq</code>	AMSsymbols			$\delta \times 2$
<code>\subsetneqq</code>	AMSsymbols			$\delta \times 2$
see also: \subsetteq , \subsetteqq , \varsubsetneq , \varsubsetneqq				
<code>\substack</code>	AMSmath		use for multi-line subscripts or superscripts	
Examples:				
<pre>\sum_{\substack{1 \leq i \leq 3 \\ 1 \leq j \leq 5}} a_{ij}</pre> yields (display mode) $\sum_{\substack{1 \leq i \leq 3 \\ 1 \leq j \leq 5}} a_{ij}$				
<pre>^{\substack{\text{a very} \\ \text{contrived} \\ \text{example}}} \\ \{\frac{a}{b}\}_{\substack{\text{isn't} \\ \text{it?}}}</pre> yields (display mode) $\overset{\substack{\text{a very} \\ \text{contrived} \\ \text{example}}}{\frac{a}{b}} \text{ isn't it?}$				
see also: \begin{subarray}				
<code>\succ</code>			see also: \nsucc	$\delta \times 2$
<code>\succapprox</code>	AMSsymbols			$\delta \times 2$
<code>\succnapprox</code>	AMSsymbols			$\delta \times 2$
<code>\succcurlyeq</code>	AMSsymbols			$\delta \times 2$
<code>\succeq</code>				$\delta \times 2$
<code>\succneqq</code>	AMSsymbols		see also: \nsucceq	$\delta \times 2$
<code>\succsim</code>	AMSsymbols			$\delta \times 2$
<code>\succnsim</code>	AMSsymbols			$\delta \times 2$
<code>\sum</code>			summation notation; changes size; can change limit placement using \limits and \nolimits ; see the Big Operators Table for examples	$\delta \times \#$
see also: \Sigma				
<code>\sup</code>		sup	supremum; greatest lower bound; does not change size; can change limit placement using \limits and \nolimits ; see the Big Operators Table for examples	
Examples:				
<code>\sup_{\rm limit}</code> yields (inline mode) \sup_{limit}				
<code>\sup_{\rm limit}</code> yields (display mode) \sup_{limit}				
see also: \inf				
<code>\supset</code>				$\delta \times 2$
<code>\Supset</code>	AMSsymbols			$\delta \times 2$
<code>\supseteq</code>				$\delta \times 2$
<code>\supsetneq</code>	AMSsymbols			$\delta \times 2$
<code>\supseteqq</code>	AMSsymbols			$\delta \times 2$
<code>\supsetneqq</code>	AMSsymbols		see also: \nsupseteq , \nsupseteqq , \varsupsetneq , \varsupsetneqq	$\delta \times 2$
<code>\surd</code>				$\delta \times 2$
<code>\swarrow</code>			southwest arrow; non-stretchy	$\delta \times 2$
see also: \nearrow , \nwarrow , \searrow				

T

<code>\tag</code>	AMSmath		used primarily in AMS math environments to get tags (equation numbers, labels); can, however, be used on any equation; the argument of <code>\tag</code> is typeset in text mode, but math mode can be used within the text: for example, <code>\tag{\\$bullet\\$}</code> You can use dollar signs in text-mode regardless of the settings of the <code>inlineMath</code> delimiters in the <code>tex2jax</code> preprocessor.	
<code>\tag #1</code>				
Example:				

		<pre>\eqalign{ 3x - 4y &= 5\cr x + 7 &= -2y }</pre> yields $3x - 4y = 5$ $x + 7 = -2y$ (3.1c) <pre>\tag{3.1c}</pre>	
<code>\tan</code>	tan	tangent; does not change size; default limit placement is the same in both inline and display modes; can change limit placement using \limits ; see the Big Operators Table for more examples Examples: <pre>\tan x</pre> yields $\tan x$ <pre>\tan(2x-1)</pre> yields $\tan(2x - 1)$ see also: \cot	class OP
<code>\tanh</code>	tanh	hyperbolic tangent; does not change size; default limit placement is the same in both inline and display modes; can change limit placement using \limits ; see the Big Operators Table for more examples Examples: <pre>\tanh x</pre> yields $\tanh x$ <pre>\tanh(2x-1)</pre> yields $\tanh(2x - 1)$ see also: \cosh , \sinh	class OP
<code>\tau</code>	τ	lowercase Greek letter tau	$\&\#x03C4$; class ORD
<code>\tbinom</code>	AMSMath	notation commonly used for binomial coefficients; in textstyle <pre>\tbinom #1 #2</pre> Examples: <pre>\tbinom n k</pre> yields (inline mode) $\binom{n}{k}$ <pre>\tbinom n k</pre> yields (display mode) $\binom{n}{k}$ <pre>\binom n k</pre> yields (display mode) $\binom{n}{k}$ <pre>\tbinom{n-1}{k-1}</pre> yields $\binom{n-1}{k} - 1$ <pre>\tbinom{n-1}{k-1}</pre> yields $\binom{n-1}{k-1}$ see also: \binom , \choose , \dbinom	
<code>\TeX</code>	\TeX	the TeX logo Examples: <pre>\TeX</pre> yields \TeX <pre>\rm\TeX</pre> yields \TeX see also: \LaTeX	class ORD
<code>\text</code> <code>\textbf</code> <code>\textit</code> <code>\textrm</code>		text boldface text italic text roman text used to produce text-mode material (in a given font) within a mathematical expression; MathJax does not process any macros within the text (unlike \TeX itself); you can get math mode within the text using $\langle \dots \rangle$ delimiters <pre>\text #1</pre> <pre>\textbf #1</pre> <pre>\textit #1</pre> <pre>\textrm #1</pre> Example: <pre> x = x \text{ for all \langle x \ge 0 \rangle}</pre> yields $ x = x$ for all $x \geq 0$ <pre>\text{\langle alpha in text mode \rangle alpha</pre> yields $\langle \alpha \text{ in text mode } \alpha$ <pre>\textbf{\langle alpha in textbf mode \rangle alpha</pre> yields $\langle \alpha \text{ in textbf mode } \alpha$ <pre>\textit{\langle alpha in textit mode \rangle alpha</pre> yields $\langle \alpha \text{ in textit mode } \alpha$ <pre>\textrm{\langle alpha in textrm mode \rangle alpha</pre> yields $\langle \alpha \text{ in textrm mode } \alpha$ in MathJax, <code>\text</code> is the same as: \hbox , \mbox see also: \rm	class ORD
<code>\textstyle</code>		used to over-ride automatic style rules and force text (inline) style; stays in force until the end of math mode or the braced group, or	class ORD

		<p>until another style is selected</p> $\{ \textstyle \dots \}$ <p>Example: In display mode: <code>\frac ab + {\textstyle \frac cd} + \frac gh</code> yields $\frac{a}{b} + \frac{c}{d} + \frac{e}{f} + \frac{g}{h}$</p> <p>Example: In inline mode: <code>\frac ab+{\displaystyle\frac ab}+\frac ab+{\scriptstyle\frac ab}+{\scriptscriptstyle\frac ab}</code> yields: $\frac{a}{b} + \frac{a}{b} + \frac{a}{b} + \frac{a}{b} + \frac{a}{b}$</p> <p>see also: \displaystyle, \scriptstyle, \scriptscriptstyle</p>	
<code>\tfrac</code>	AMSmath	<p>textstyle fraction</p> $\tfrac{\#1}{\#2}$ <p>Examples: <code>\tfrac ab \frac ab</code> (display mode) yields $\frac{a}{b} \frac{a}{b}$ <code>\tfrac ab \frac ab</code> (inline mode) yields $\frac{a}{b} \frac{a}{b}$</p> <p>see also: \frac, \dfrac</p>	
<code>\therefore</code>	AMSsymbols	\therefore	$\&\#x2234$ class REL
<code>\theta</code> <code>\Theta</code>		θ Θ	$\&\#x03B8$; class ORD $\&\#x0398$; class ORD
<code>\thickapprox</code>	AMSsymbols	\approx	$\&\#x2248$; class REL
<code>\thicksim</code>	AMSsymbols	\sim	$\&\#x223C$; class REL
<code>\thinspace</code>			thin space; normally $\frac{1}{6}$ of a quad Example: thinspaces between letters: $abcd$ see also: symbols for spaces , \negthinspace
<code>\tilde</code>		\sim	$\&\#x02DC$; $\tilde{\#1}$ Usually, #1 is a single letter; otherwise, accent is centered over argument. Examples: <code>\tilde e</code> yields \tilde{e} <code>\tilde E</code> yields \tilde{E} <code>\tilde eu</code> yields \tilde{eu} <code>\tilde{eu}</code> yields $e\tilde{u}$
<code>\times</code>		\times	$\&\#x00D7$; class BIN
<code>\tiny</code>			turns on tiny; a bit smaller than <code>\Tiny</code> class ORD $\{\tiny \dots\}$ Examples: <code>\tiny AaBb\alpha\beta123</code> yields $AaBb\alpha\beta123$ <code>\{tiny A B\} A B</code> yields $ABAB$ <code>\tiny AB \Tiny CD</code> yields $ABAB$ <code>\tiny{AB}CD</code> yields $ABCD$
<code>\Tiny</code>	non-standard		turns on Tiny; a bit bigger than <code>\tiny</code> class ORD $\{\Tiny \dots\}$ Examples: <code>\Tiny AaBb\alpha\beta123</code> yields $AaBb\alpha\beta123$ <code>\{Tiny A B\} A B</code> yields $ABAB$ <code>\Tiny AB \tiny CD</code> yields $ABAB$ <code>\Tiny{AB}CD</code> yields $ABCD$
<code>\to</code>		\rightarrow	$\&\#x2192$; class REL see also: \rightarrow
tool tips			Tool tips are not built into MathJax, but you can click here to benefit from a posting by Davide P. Cervone (April 2011) at the MathJax Users Group .
<code>\top</code>		\top	$\&\#x22A4$; class ORD
<code>\triangle</code> <code>\triangledown</code>	AMSsymbols	\triangle \triangledown	$\&\#x25B3$; class ORD $\&\#x25BD$; class ORD

		see also: \triangleleft , \triangleright , \vartriangle , \vartriangleleft , \vartriangleright	
<code>\triangleleft</code> <code>\triangleright</code>	\triangleleft \triangleright		$\&\#x25C3$; class BIN $\&\#x25B9$; class BIN
		see also: \triangleleft , \triangleright , \vartriangle , \vartriangleleft , \vartriangleright

		see also: \trianglelefteq , \trianglerighteq	
<code>\triangleq</code> AMSsymbols	\triangleq		$\&\#x225C$; class REL
<code>\tt</code>		turns on typewriter type Examples: <code>\tt AaBb\alpha\beta123</code> yields AaBb$\alpha\beta$123 <code>{\tt A B} A B</code> yields ABAB <code>\tt AB \rm CD</code> yields ABAB <code>\tt{AB}CD</code> yields ABCD	class ORD
<code>\twoheadleftarrow</code> AMSsymbols <code>\twoheadrightarrow</code> AMSsymbols	\twoheadleftarrow \twoheadrightarrow	non-stretchy non-stretchy	$\&\#x219E$; class REL $\&\#x21A0$; class REL

U

<code>\ulcorner</code> AMSsymbols <code>\urcorner</code> AMSsymbols	\ulcorner \urcorner	upper left corner upper right corner These are technically delimiters, but MathJax doesn't stretch them. They are valid after <code>\left</code> , <code>\right</code> , and the various <code>\big</code> commands. see also: \llcorner , \lrcorner	$\&\#x250C$; class REL $\&\#x2510$; class REL
<code>\underbrace</code>		puts a (stretchy) under-brace under the argument; can use <code>^</code> to place an optional superscript over the argument; can use <code>_</code> to place an optional subscript below the underbrace Example: <code>\underbrace{x + \cdots + x}_{n\rm times}^{\text{(note here)}}</code> yields $x + \cdots + x$ <small>n times</small> see also: \overbrace	$\&\#x2199$; $\&\#x2192$; $\&\#x2194$;
<code>\underleftarrow</code> <code>\underrightarrow</code> <code>\underleftrightharrow</code>	\underleftarrow \underrightarrow \underleftrightharrow	stretchy under left arrow stretchy under right arrow stretchy under left right arrow Examples: <code>\underleftarrow{\text{the argument}}</code> yields $\underleftarrow{\text{the argument}}$ <code>\underrightarrow{AB}</code> yields \underrightarrow{AB} <code>\underrightarrow{AB\strut}</code> yields \underrightarrow{AB} <code>\underleftrightharrow{\hspace{1in}}</code> yields $\underleftrightharrow{\hspace{1in}}$	$\&\#x2199$; $\&\#x2192$; $\&\#x2194$;
<code>\underline</code>	\underline	stretchy underline Examples: <code>\underline{AB}</code> yields \underline{AB} <code>\underline a</code> yields $\underline a$ <code>\underline{\text{a long argument}}</code> yields $\underline{\text{a long argument}}$	$\&\#x005F$;
<code>\underset</code>		undersets argument #1 (in scriptstyle) under argument #2; the top item is properly aligned with the surrounding text (their baselines match) Examples: <code>\underset{\rm bottom}{\rm top}</code> yields $\underset{\text{bottom}}{\text{top}}$	

			$\underset{a}{b}$ yields $\underset{a}{b}$ see also: \overset
<code>\unicode</code> non-standard			implements a <code>\unicode{}</code> extension to T_EX that allows arbitrary unicode code points to be entered in mathematics; can optionally specify height and depth of character (width is determined by browser); can optionally specify the default font from which to take the character; once a size and font are provided for a given unicode point, they need not be specified again in subsequent <code>\unicode{}</code> calls for that character See MathJax TeX and LaTeX Support: Unicode Support for more details. $\text{\unicode[optHeight,optDepth][optFont]\#1}$ Examples: <code>\unicode{x263a}</code> yields ☺ <code>&\#x263a;</code> yields (in math mode) ☺ <code>\unicode[.55,0.05]{x22D6}</code> yields ⋖ less-than with dot, with height 0.55em and depth 0.05em <code>\unicode[.55,0.05][Geramond]{x22D6}</code> yields ⋖ same, taken from Geramond font <code>\unicode[Geramond]{x22D6}</code> yields ⋖ same, but with default (height,depth) of (0.8em,0.2em)
<code>\unlhd</code> AMSsymbols	\triangleleft		underlined left-hand (left-pointing) diamond \triangleleft <code>&\#x22B4;</code> class REL
<code>\unrhd</code> AMSsymbols	\triangleright		underlined right-hand (right-pointing) diamond \triangleright <code>&\#x22B5;</code> class REL
<code>\uparrow</code>	\uparrow		non-stretchy <code>&\#x2191;</code> class REL
<code>\Uparrow</code>	\Uparrow		non-stretchy <code>&\#x21D1;</code> class REL
<code>\updownarrow</code>	\updownarrow		non-stretchy <code>&\#x2195;</code> class REL
<code>\Updownarrow</code>	\Updownarrow		non-stretchy <code>&\#x21D5;</code> class REL
<code>\upharpoonleft</code> AMSsymbols	\upharpoonleft		non-stretchy <code>&\#x21BF;</code> class REL
<code>\upharpoonright</code> AMSsymbols	\upharpoonright		non-stretchy <code>&\#x21BE;</code> class REL
<code>\uplus</code>	\uplus		<code>&\#x228E;</code> class BIN
<code>\uproot</code>			used to fine-tune the placement of the index inside <code>\sqrt</code> or <code>\root</code> (see examples) $\sqrt[\uproot]{...}$ $\root ... \uproot \#1 ... \of \{...\}$ where the argument is a small integer: a positive integer moves the index up; a negative integer moves the index down In actual TeX, <code>\uproot</code> is not allowed in <code>\root</code> , so this is a difference between MathJax and T_EX . Examples: <code>\sqrt[3]{x}</code> yields $\sqrt[3]{x}$ <code>\sqrt[3\uproot2]{x}</code> yields $\sqrt[3]{x}$ <code>\root 3 \of x</code> yields $\sqrt[3]{x}$ <code>\root 3\uproot{-2} \of x</code> yields $\sqrt[3]{x}$ see also: \leftroot , \root
<code>\upsilon</code>	υ		lowercase Greek letter upsilon <code>&\#x03C5;</code> class ORD
<code>\Upsilon</code>	Υ		uppercase Greek letter upsilon <code>&\#x03A5;</code> class ORD see also: \varupsilon , \varUpsilon

environments

AT_EX environments of the form `\begin{XXX} ... \end{XXX}` are provided, as listed in the table below.

The `processEnvironments` value in the `tex2jax` block of the MathJax configuration controls processing behavior:

- `processEnvironments: true` (the default) causes environments to be processed both inside *and outside* of math delimiters
- `processEnvironments: false` causes environments to be processed only when they appear inside math delimiters

See the [tex2jax Preprocessor](#) for details.

<p><code>align</code> <code>AMSmath</code></p> <pre>\begin{align} ... \end{align}</pre>	<p>For vertical alignment of two or more lines at one or more places:</p> <ul style="list-style-type: none"> • ampersand(s) ‘&’ are used to indicate desired alignments (see examples below) • a double backslash ‘\’ or carriage return ‘\cr’ separates lines • individual lines may be tagged using the <code>\tag{}</code> command: <ul style="list-style-type: none"> ◦ default input for <code>\tag{}</code> is text ◦ you may get mathematical content inside <code>\tag{}</code> by using math delimiters; e.g., <code>\tag{\$\alpha\$}</code> <p>EXAMPLES:</p> <p>Alignment at a single location:</p> <ul style="list-style-type: none"> • use a single ampersand where alignment should occur • you may tag (or not tag) any desired subset of lines <pre>\begin{align} (a+b)^2 &= (a+b)(a+b) && \tag{3.1c} && \\ &= a^2 + ab + ba + b^2 && \tag{\$\dagger\$} && \\ &= a^2 + 2ab + b^2 && \tag{\$\ast\$} && \\ \end{align}</pre> <p>yields</p> $\begin{aligned} (a + b)^2 &= (a + b)(a + b) && (3.1c) \\ &= a^2 + ab + ba + b^2 && (\dagger) \\ &= a^2 + 2ab + b^2 && (*) \end{aligned}$ <p>Alignment at more than one location is trickier.</p> <p>It is best illustrated with an example: show/hide more info</p> <p>Let n denote the number of places where alignment is desired. Then, there will be $2n - 1$ ampersands used.</p> <ul style="list-style-type: none"> • STEP 1: The odd-numbered ampersands (1st, 3rd, 5th, etc.) are placed where alignment is desired. Position these ampersands first: <pre>a &= bbbbbb &= cc &= d \\ aaa &= bbbb &= cccccc &= ddd</pre> <ul style="list-style-type: none"> • STEP 2: Now, focus attention on the content <i>between</i> the previously-positioned ampersands. What part of this content belongs on the left? On the right? In each group, use an ampersand to separate the content into two pieces (a piece may be empty). Think of this ampersand as a solid ‘wall’ that is pushing content to the left or right. <p>Compare these three scenarios:</p> <p>Pushing all content to the left:</p> <pre>\begin{align} a &= bbbbbb &= cc &= d \\ aaa &= bbbb &= cccccc &= ddd \\ \end{align}</pre> <p>yields</p> $\begin{aligned} a &= bbbbbb &= cc &= d && (28) \\ aaa &= bbbb &= cccccc &= ddd && (29) \end{aligned}$ <p>Pushing all content to the right:</p> <pre>\begin{align} a &= & bbbbbb &= & cc &= d \\ aaa &= & bbbb &= & cccccc &= ddd \\ \end{align}</pre> <p>yields</p> $\begin{aligned} a &= & bbbbbb &= & cc &= d && (30) \\ aaa &= & bbbb &= & cccccc &= ddd && (31) \end{aligned}$ <p>Splitting the content, with half left and half right:</p> <pre>\begin{align} a &= bbb&bbb &= c&c &= d \\ \end{align}</pre>
--	---

		<pre>aaa &= bb&bb &= ccc&ccc &= ddd \end{align}</pre> <p>yields</p> $\begin{array}{rcl} a = & bbb & \quad bbb = c \quad \quad c = d \\ aaa = & bb & \quad bb = ccc \quad \quad ccc = ddd \end{array} \quad \begin{array}{l} (32) \\ (33) \end{array}$ <p>see also: \eqalign, \eqalignno, \legalignno, \begin{aligned}</p>
align*	AMSMath	[May 2011] same as align
alignat	AMSMath	<p>For vertical alignment of two or more lines at one or more places; produces a more horizontally-compressed display than align:</p> <ul style="list-style-type: none"> the alignat environment is started with <code>\begin{alignat}{<num>}</code>, where <code>num</code> is a positive integer (1, 2, 3, ...) that indicates the number of places where alignment is desired ampersand(s) ‘&’ are used to indicate desired alignments (see examples below) a double backslash ‘\’ or carriage return ‘\cr’ separates lines individual lines may be tagged using the <code>\tag{}</code> command: <ul style="list-style-type: none"> default input for <code>\tag{}</code> is text you may get mathematical content inside <code>\tag{}</code> by using math delimiters; e.g., <code>\tag{\alpha}</code> <p>Let n denote the number of places where alignment is desired. Then, there will be $2n - 1$ ampersands used, as follows:</p> <ul style="list-style-type: none"> STEP 1: The odd-numbered ampersands (1st, 3rd, 5th, etc.) are placed where alignment is desired. Position these ampersands first: <pre>a &= bbb&bb &= cc &= d \\ aaa &= bbb &= ccc&cc &= ddd</pre> STEP 2: Now, focus attention on the content <i>between</i> the previously-positioned ampersands. What part of this content belongs on the left? On the right? In each group, use an ampersand to separate the content into two pieces (a piece may be empty). Think of this ampersand as a solid ‘wall’ that is pushing content to the left or right. <p>Compare these three scenarios: Pushing all content to the left:</p> <pre>\begin{alignat}{3} a &= bbb&bb& &= cc &= d \tag{3.1} \\ aaa &= bbb& &= ccc&cc& &= ddd \tag{3.2} \end{alignat}</pre> <p>yields</p> $a = bbb&bb = cc = d \quad (3.1)$ $aaa = bbb = ccc&cc = ddd \quad (3.2)$ <p>Pushing all content to the right:</p> <pre>\begin{alignat}{3} a &= & bbb&bb &= & cc &= d \\ aaa &= & bbb &= & ccc&cc &= ddd \end{alignat}</pre> <p>yields</p> $a = bbb&bb = cc = d \quad (34)$ $aaa = bbb = ccc&cc = ddd \quad (35)$ <p>Splitting the content, with half left and half right:</p> <pre>\begin{alignat}{3} a &= bbb&bb &= c &= d \\ aaa &= bb&bb &= ccc&cc &= ddd \end{alignat}</pre> <p>yields</p> $a = bbb&bb = c = d \quad (36)$ $aaa = bb = ccc&cc = ddd \quad (37)$ <p>see also: \eqalignat, \eqalignatno, \legalignatno, \begin{alignedat}</p>
alignat*	AMSMath	[May 2011] same as alignat
aligned	AMSMath	<p>same as \begin{align}, but allows only a single tag, which is vertically centered on the group</p> <p>Examples:</p> <pre>\begin{aligned} \tag{3.1} x_1 &= 1\cr x_2 &= 1 + 2\cr \end{aligned} \begin{aligned} x_1 &= 1 \tag{3.1}\cr x_2 &= 1 + 2\cr x_3 &= 1 + 2 + 3 \end{aligned} \begin{aligned} x_1 &= 1\cr x_2 &= 1 + 2\cr \tag{3.1} x_3 &= 1 + 2 + 3 \end{aligned}</pre>

		<pre>x_3 &= 1 + 2 + 3 \end{aligned} \end{aligned} \end{aligned}</pre> <p>all yield the same display:</p> $\begin{aligned} x_1 &= 1 \\ x_2 &= 1 + 2 \\ x_3 &= 1 + 2 + 3 \end{aligned} \tag{3.1}$
alignedat	AMSmath	<p>same as <code>\begin{alignat}</code>, but allows only a single tag, which is vertically centered on the group</p> <p>Examples:</p> <pre>\begin{alignedat}{1} \tag{3.1} x_1 &= 1\cr x_2 &= 1 + 2\cr x_3 &= 1 + 2 + 3 \end{alignedat}</pre> <pre>\begin{alignedat}{1} x_1 &= 1 \tag{3.1}\cr x_2 &= 1 + 2\cr x_3 &= 1 + 2 + 3 \end{alignedat}</pre> <pre>\begin{alignedat}{1} x_1 &= 1\cr x_2 &= 1 + 2\cr \tag{3.1} x_3 &= 1 + 2 + 3 \end{alignedat}</pre> <p>all yield the same display:</p> $\begin{aligned} x_1 &= 1 \\ x_2 &= 1 + 2 \\ x_3 &= 1 + 2 + 3 \end{aligned} \tag{3.1}$
array		<p>Used to create an array (matrix), where columns can be individually left-justified, centered, or right-justified.</p> <ul style="list-style-type: none"> • suppose that n columns are desired in the array; then, $n - 1$ ampersands are used to separate the columns • the array environment is started with <code>\begin{array}{<justification info>}</code>, where <code><justification info></code> is a series of n letters, one for each column: <ul style="list-style-type: none"> ◦ 'l' for left-justified ◦ 'c' for centered ◦ 'r' for right-justified ◦ pipe character(s) ' ' can be used in the justification information to specify optional separating vertical line(s) (see example below) • a double backslash '\\' or carriage return '\cr' separates rows <p>Compare these scenarios:</p> <p>both columns left-justified:</p> <pre>\begin{array}{ll} aaa & b\cr c & ddd \end{array}</pre> <p>yields</p> $\begin{array}{ll} aaa & b \\ c & ddd \end{array}$ <p>both columns right-justified:</p> <pre>\begin{array}{rr} aaa & b\cr c & ddd \end{array}</pre> <p>yields</p> $\begin{array}{rr} aaa & b \\ c & ddd \end{array}$ <p>both columns centered, with separating line:</p> <pre>\begin{array}{c c} aaa & b\cr c & ddd \end{array}</pre> <p>yields</p> $\begin{array}{c c} aaa & b \\ c & ddd \end{array}$ <p>first column left-justified; second column right-justified:</p> <pre>\begin{array}{lr} aaa & b\cr c & ddd \end{array}</pre> <p>yields</p> $\begin{array}{lr} aaa & b \\ c & ddd \end{array}$ <p>Putting a pipe character ' ' at the beginning or end of the justification info encloses the entire structure, which is different from standard \TeX:</p>

		<pre>\begin{array}{ lr} aaa & b\cr c & ddd \end{array}</pre> <p>yields</p> $\begin{array}{ l} aaa & b \\ c & ddd \end{array}$ <p>see also: \begin{matrix}, \begin{subarray}</p>
Bmatrix		<pre>\begin{Bmatrix} ... \end{Bmatrix}</pre> <p>Used to create a matrix (an array) with braces { , } as enclosing delimiters; columns are centered.</p> <ul style="list-style-type: none"> suppose that n columns are desired in the array; then, $n - 1$ ampersands are used to separate the columns a double backslash '\ ' or carriage return '\cr' separates rows <p>Example:</p> <pre>\begin{Bmatrix} aaa & b\cr c & ddd \end{Bmatrix}</pre> <p>yields $\begin{Bmatrix} aaa & b \\ c & ddd \end{Bmatrix}$</p> <p>see also: \begin{array}, \begin{matrix}</p>
bmatrix		<pre>\begin{bmatrix} ... \end{bmatrix}</pre> <p>Used to create a matrix (an array) with brackets [,] as enclosing delimiters; columns are centered.</p> <ul style="list-style-type: none"> suppose that n columns are desired in the array; then, $n - 1$ ampersands are used to separate the columns a double backslash '\ ' or carriage return '\cr' separates rows <p>Example:</p> <pre>\begin{bmatrix} aaa & b\cr c & ddd \end{bmatrix}</pre> <p>yields $\begin{bmatrix} aaa & b \\ c & ddd \end{bmatrix}$</p> <p>see also: \begin{array}, \begin{matrix}</p>
cases		<pre>\begin{cases} ... \end{cases}</pre> <p>Used for piecewise-defined functions</p> <ul style="list-style-type: none"> an ampersand '&' is used to separate the function cases and their definitions a double backslash '\ ' or carriage return '\cr' separates rows <p>Example:</p> <pre> x = \begin{cases} x & \text{if } x \ge 0 \\ -x & \text{if } x < 0 \end{cases}</pre> <p>yields $x = \begin{cases} x & \text{if } x \ge 0 \\ -x & \text{if } x < 0 \end{cases}$</p> <p>see also: \cases</p>
eqnarray		<p>for 'equation arrays'; aligns at one or more places; surround the character(s) to be aligned with ampersands, as shown below; content between alignment characters (or between alignment characters and end-of-line) is left-justified; a double backslash '\ ' or carriage return '\cr' separates rows</p> <p>Examples:</p> <pre>\begin{eqnarray} y & \&= & (x-1)^2 \\ & \&= & (x-1)(x-1) \\ & \&= & x^2 - 2x + 1 \end{eqnarray}</pre> <p>yields</p> $y = (x - 1)^2 \tag{38}$ $= (x - 1)(x - 1) \tag{39}$ $= x^2 - 2x + 1 \tag{40}$ <pre>\begin{eqnarray} (x-1)^2 & \&= & (x-1)(x-1) & \&= & x^2-2x + 1 \\ (x-1)^3 & \&= & (x-1)(x-1)(x-1) & \&= & (x-1)^2(x-1) \end{eqnarray}</pre> <p>yields</p> $(x - 1)^2 = (x - 1)(x - 1) = x^2 - 2x + 1 \tag{41}$ $(x - 1)^3 = (x - 1)(x - 1)(x - 1) = (x - 1)^2(x - 1) \tag{42}$
eqnarray*		[May 2011] same as equarray
equation		[May 2011] ignored, until MathJax implements automatic numbering
\begin{equation} ... \end{equation}		
equation*		[May 2011] ignored

<p>gather</p> <p>AMSmath</p>		<p>to display any number of centered formulas (without any alignment); a double backslash '\\ or carriage return '\cr' separates rows; individual lines may be tagged using the \tag{} command:</p> <ul style="list-style-type: none"> • default input for \tag{} is text • you may get mathematical content inside \tag{} by using math delimiters; e.g., \tag{\$\alpha\$} <p>Example:</p> <pre>\begin{gather} a = a \tag{\${}\$} \\ \text{if } a=b \text{ then } b=a \tag{\${\dagger}\$} \\ \text{if } a=b \text{ and } b=c \text{ then } a=c \tag{3.1} \end{gather}</pre> <p>yields:</p> $ \begin{array}{r} a = a \qquad \qquad \qquad (*) \\ \text{if } a = b \text{ then } b = a \qquad \qquad \qquad (\dagger) \\ \text{if } a = b \text{ and } b = c \text{ then } a = c \qquad \qquad \qquad (3.1) \end{array} $ <p>see also: \displaylines, \begin{gathered}</p>
<p>gather*</p> <p>AMSmath</p>		<p>[May 2011] same as gather</p>
<p>gathered</p> <p>AMSmath</p>		<p>same as \begin{gather}, but allows only a single tag, which is vertically centered on the group</p> <p>Examples:</p> <pre>\begin{gathered} \tag{3.1} x = 1\cr y = 2\cr z = 3 \end{gathered} \begin{gathered} x = 1 \tag{3.1}\cr y = 2\cr z = 3 \end{gathered} \begin{gathered} x = 1\cr y = 2\cr \tag{3.1} z = 3 \end{gathered}</pre> <p>all yield the same display:</p> $ \begin{array}{r} x = 1 \\ y = 2 \\ z = 3 \end{array} \tag{3.1} $
<p>matrix</p> <pre>\begin{matrix} ... \end{matrix}</pre>		<p>Used to create a matrix (an array) without any enclosing delimiters; columns are centered.</p> <ul style="list-style-type: none"> • suppose that n columns are desired in the array; then, $n - 1$ ampersands are used to separate the columns • a double backslash '\\ or carriage return '\cr' separates rows <p>Example:</p> <pre>\begin{matrix} aaa & b\cr c & ddd \end{matrix}</pre> <p>yields</p> $ \begin{array}{cc} aaa & b \\ c & ddd \end{array} $ <p>see also: \begin{array}</p>
<p>multiline</p> <p>AMSmath</p> <pre>\begin{multiline} ... \end{multiline}</pre>		<p>a multi-line environment; typically used for formulas/equations that don't fit on a single line</p> <ul style="list-style-type: none"> • the first (or only) line is displayed left-justified • the last line is displayed right-justified • any intermediate line(s) are centered <p>The justification of intermediate lines can be adjusted with \shoveleft and \shoveright.</p> <p>Examples:</p> <pre>\begin{multiline} \rm first\ line \\ \rm second\ line \\ \rm third\ line \\ \rm fourth\ line \end{multiline}</pre> <p>yields:</p> $ \begin{array}{l} \text{first line} \\ \qquad \qquad \qquad \text{second line} \\ \qquad \qquad \qquad \text{third line} \\ \qquad \qquad \qquad \qquad \qquad \text{fourth line(43)} \end{array} $ <pre>\begin{multiline} \rm first\ line \\ \shoveleft\rm second\ line \\ \shoveright\rm third\ line \\ \rm fourth\ line \end{multiline}</pre> <p>yields:</p>

		<p>first line second line</p> <p style="text-align: right;">third line fourth line(44)</p> <p>see also: \begin{split}</p>
multline* [AMSMath]		<p>[May 2011] same as multline see also: \shoveleft, \shoveright</p>
pmatrix		<p>Used to create a matrix (an array) with parentheses (,) as enclosing delimiters; columns are centered.</p> <ul style="list-style-type: none"> • suppose that n columns are desired in the array; then, $n - 1$ ampersands are used to separate the columns • a double backslash '\\ or carriage return '\cr' separates rows <p>Example:</p> <pre>\begin{pmatrix} aaa & b\cr c & ddd \end{pmatrix}</pre> <p>yields $\begin{pmatrix} aaa & b \\ c & ddd \end{pmatrix}$</p> <p>see also: \begin{array}, \begin{matrix}</p>
smallmatrix AMSmath		<p>Used to create a small matrix (an array); particularly suited for use in text; columns are centered.</p> <ul style="list-style-type: none"> • suppose that n columns are desired in the array; then, $n - 1$ ampersands are used to separate the columns • a double backslash '\\ or carriage return '\cr' separates rows <p>Examples:</p> <pre>the matrix \$\begin{smallmatrix} aaa & b\cr c & ddd \end{smallmatrix}\$ is...</pre> <p>yields the matrix $\begin{smallmatrix} aaa & b \\ c & ddd \end{smallmatrix}$ is...</p> <pre>\left[\begin{smallmatrix} aaa & b\cr c & ddd \end{smallmatrix} \right]</pre> <p>yields (in display mode) $\left[\begin{smallmatrix} aaa & b \\ c & ddd \end{smallmatrix} \right]$</p> <pre>\left[\begin{smallmatrix} aaa & b\cr c & ddd \end{smallmatrix} \right]</pre> <p>yields (in inline mode) $\left[\begin{smallmatrix} aaa & b \\ c & ddd \end{smallmatrix} \right]$</p> <p>see also: \begin{array}, \begin{matrix}</p>
split AMSmath		<p>for single equations that are too long to fit on one line, and hence must be split into multiple lines; allows for (optional) alignment at one or more places, using '&' to mark alignment points</p> <p>Examples:</p> <pre>\begin{split} \text{first line}\quad &\text{second aligned place} \quad \quad \\ &\text{and more first aligned}\quad \quad \quad \text{and more second aligned} \quad \quad \\ \text{no ampersands on this line} \quad \quad \quad &\text{aligned at second place} \quad \quad \\ & \text{no amps here either} \quad \quad \quad & \end{split}</pre> <p>yields:</p> <p style="text-align: center;">first line</p> <p style="text-align: center;">first aligned place second aligned place and more first aligned and more second aligned</p> <p>no ampersands on this line</p> <p style="text-align: right;">aligned at second place</p> <p style="text-align: center;">no amps here either</p> <p>see also: \begin{multline}</p>
subarray		<p>a more compact version of \begin{array}; can be used for multi-subscripts and multi-superscripts on large operators; columns can be individually left-justified, centered, or right-justified</p> <ul style="list-style-type: none"> • suppose that n columns are desired in the subarray; then, $n - 1$ ampersands are used to separate the columns • the subarray environment is started with <code>\begin{subarray}{<justification info>}</code>, where <code><justification info></code> is a series of n letters, one for each column: <ul style="list-style-type: none"> ◦ 'l' for left-justified ◦ 'c' for centered ◦ 'r' for right-justified • a double backslash '\\ or carriage return '\cr' separates rows <p>Example:</p>

		<pre>\prod_{\begin{subarray}{r} i<5 & j>1 \\ k\ge 2, k\ne 5 \quad & \ell\le 5, \ell\ne 2 \\ \end{subarray}} x_{ijk\ell}</pre> <p>yields</p> $\prod_{\substack{i<5 & j>1 \\ k\ge 2, k\ne 5 & \ell\le 5, \ell\ne 2}} x_{ijkl}$ <p>see also: \substack, \begin{array}</p>
<p>Vmatrix</p> <pre>\begin{Vmatrix} ... \end{Vmatrix}</pre>		<p>Used to create a matrix (an array) with $\ , \$ as enclosing delimiters; columns are centered.</p> <ul style="list-style-type: none"> • suppose that n columns are desired in the array; then, $n - 1$ ampersands are used to separate the columns • a double backslash <code>\\</code> or carriage return <code>\cr</code> separates rows <p>Example:</p> <pre>\begin{Vmatrix} aaa & b \\ c & ddd \\ \end{Vmatrix}</pre> <p>yields $\ \begin{array}{cc} aaa & b \\ c & ddd \end{array} \$</p> <p>see also: \begin{array}, \begin{matrix}</p>
<p>vmatrix</p> <pre>\begin{vmatrix} ... \end{vmatrix}</pre>		<p>Used to create a matrix (an array) with $,$ as enclosing delimiters; columns are centered.</p> <ul style="list-style-type: none"> • suppose that n columns are desired in the array; then, $n - 1$ ampersands are used to separate the columns • a double backslash <code>\\</code> or carriage return <code>\cr</code> separates rows <p>Example:</p> <pre>\begin{vmatrix} aaa & b \\ c & ddd \\ \end{vmatrix}</pre> <p>yields $\begin{array}{cc} aaa & b \\ c & ddd \end{array}$</p> <p>see also: \begin{array}, \begin{matrix}</p>
